Neutron Star Interior Composition Explorer (NICER)

NICER X-ray Timing:

- High sensitivity in soft X-ray band (0.2 – 12 KeV)
- High time and energy resolution

Pulse profile modelling of rotation powered pulsars

NASA's Goddard Space Flight Center

NICER's Primary Target: PSR J0437-4715

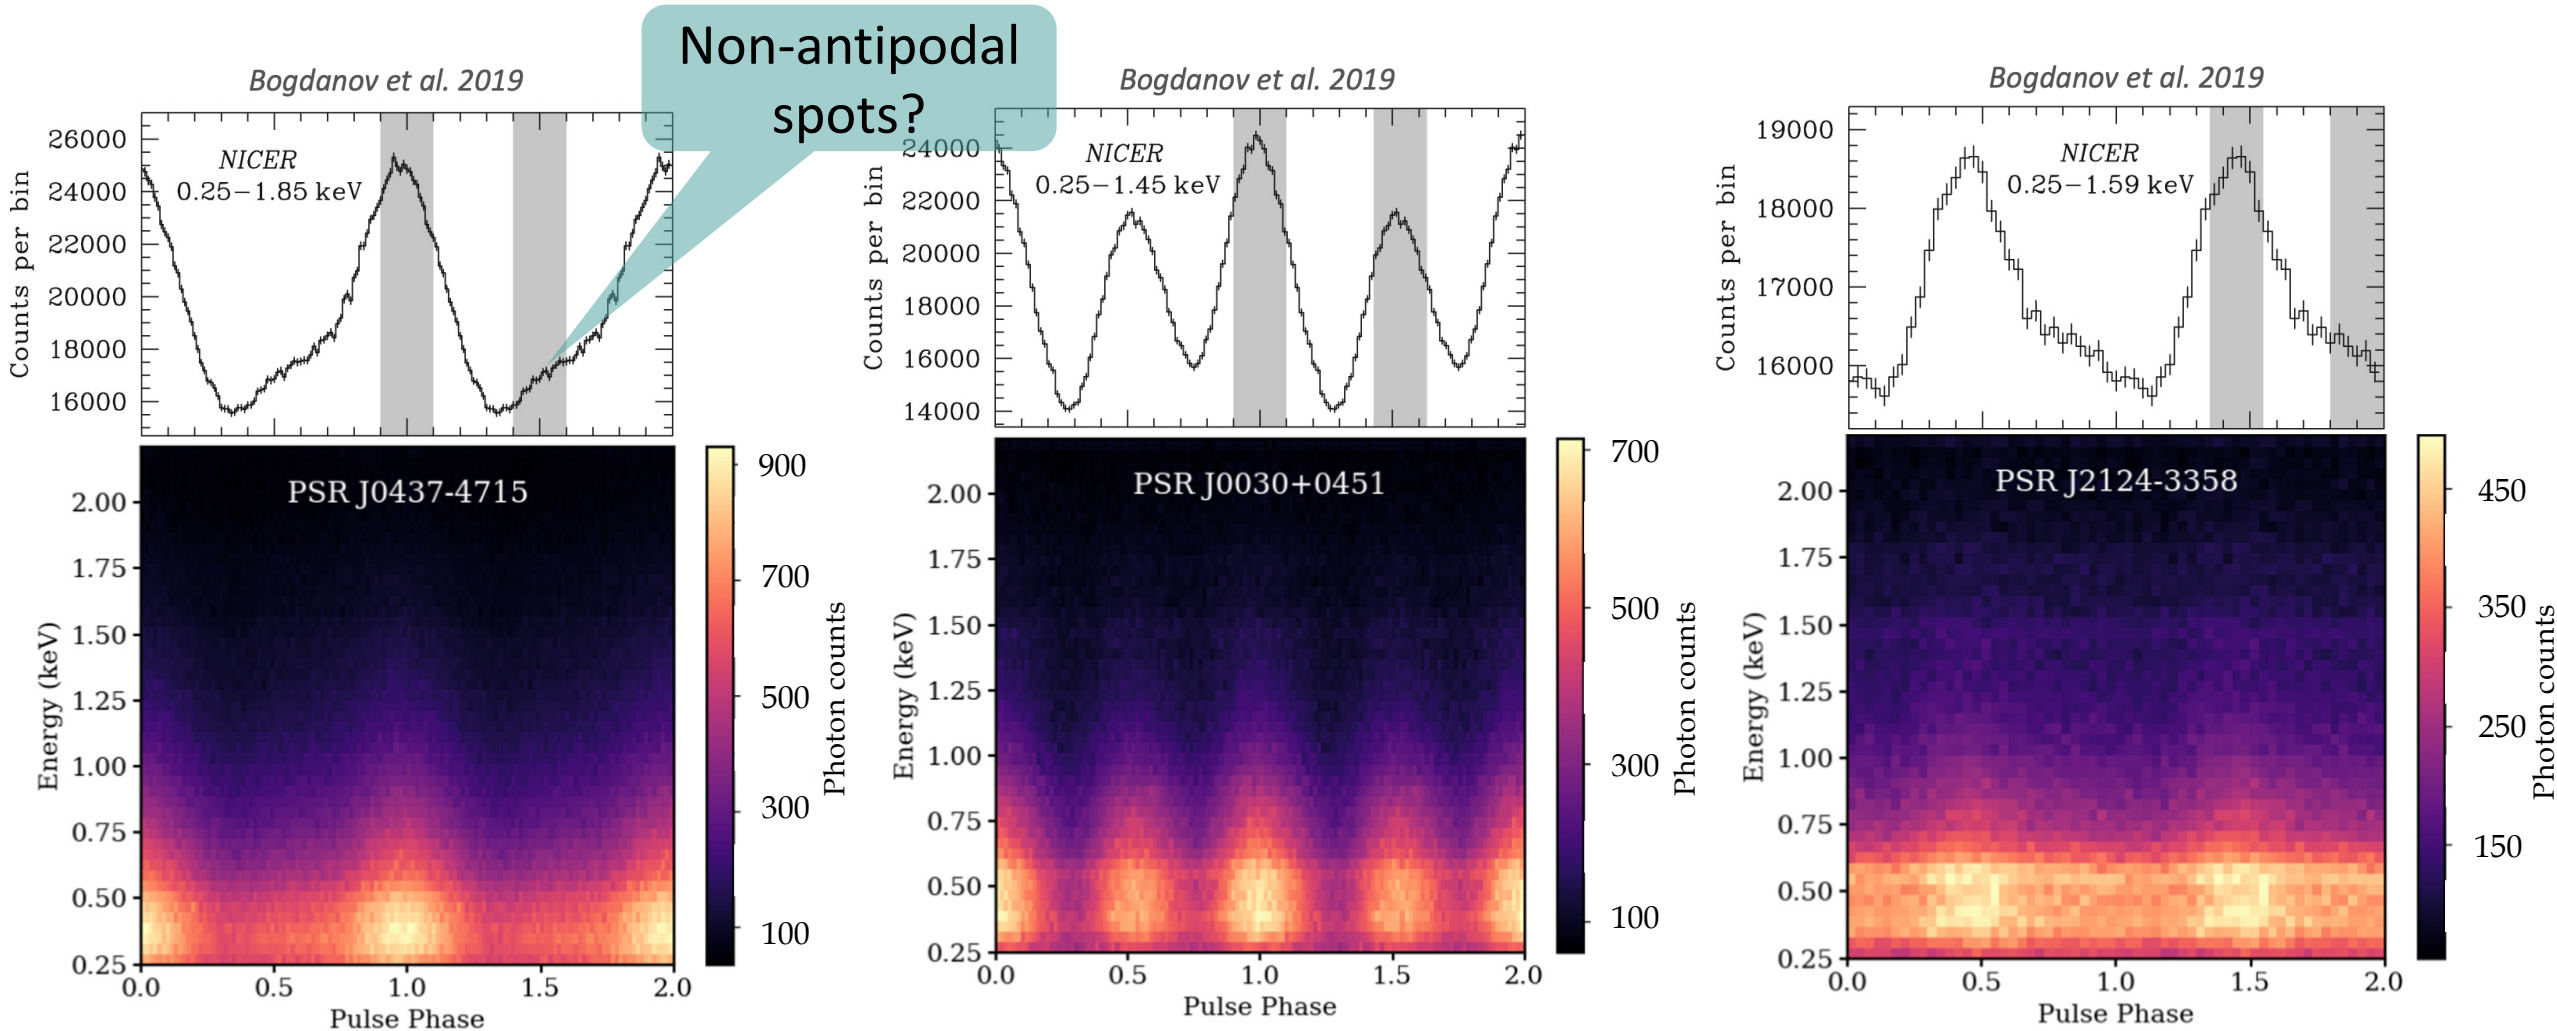

- Closest millisecond pulsar
- Brightest NICER source
- Binary system – tight mass and inclination constraints

NICER's Primary Target: PSR J0437-4715

- Closest millisecond pulsar
- Brightest NICER source
- Binary system – tight mass and inclination constraint

NICER's Primary Target: PSR J0437-4715

- Best data quality – invites modelling challenges – unexplained features can't be swept off as noise!

PSR J0437-4715: 3C50 Data Set & BKG

- Observed between 6 Jul 2017 – 12 Mar 2019
- 951 ks of observation

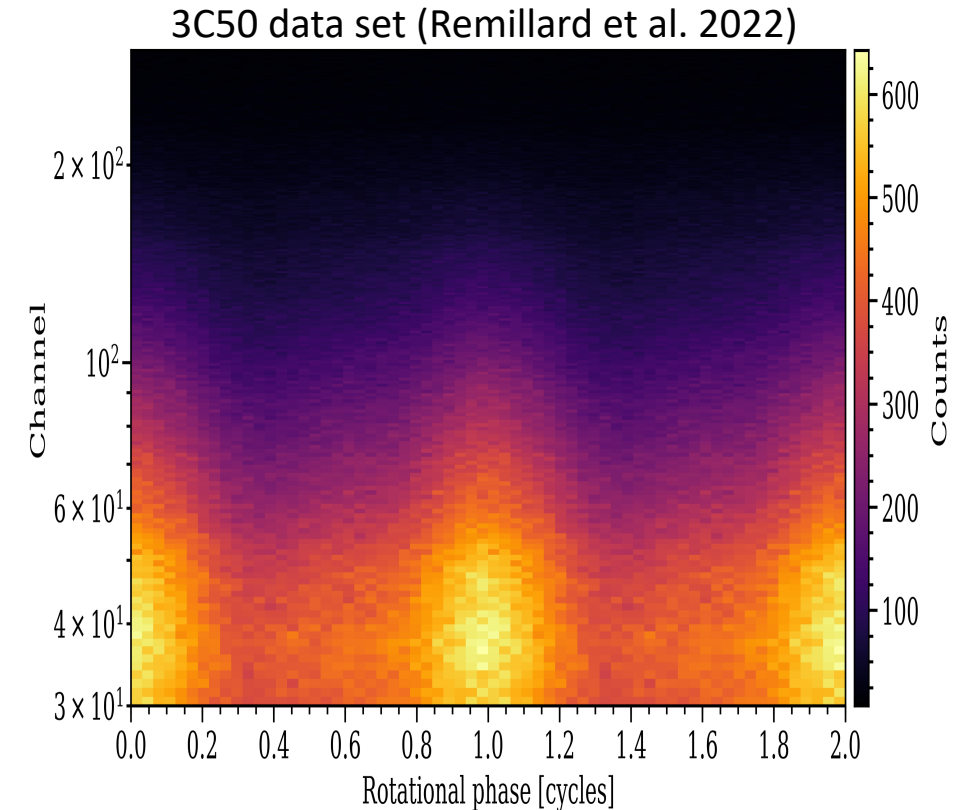

- Observed between 20 Jul 2017 – 11 Oct 2021
- 1.3 Ms of observation

PSR J0437-4715: 3C50 Data Set & BKG

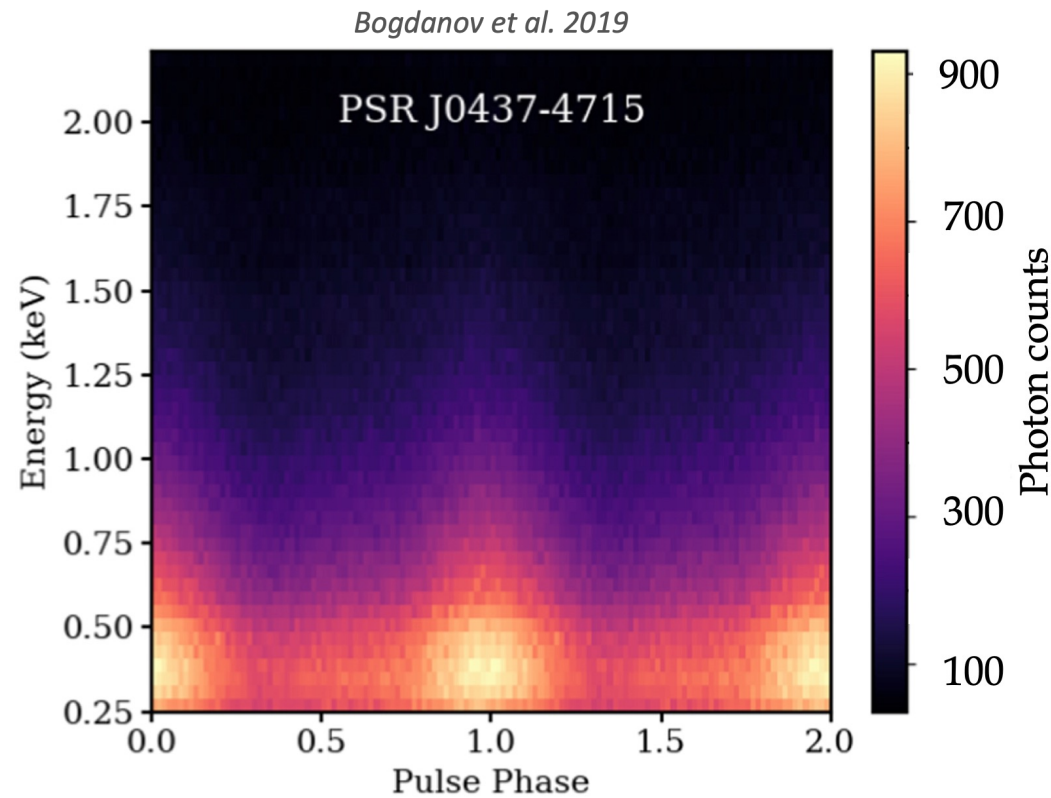

- Observed between 6 Jul 2017 – 12 Mar 2019
- 951 ks of observation
- No BKG constraint

- Observed between 20 Jul 2017 – 11 Oct 2021
- 1.3 Ms of observation
- Provides instrument BKG estimate

PSR J0437-4715: 3C50 Data Set & BKG

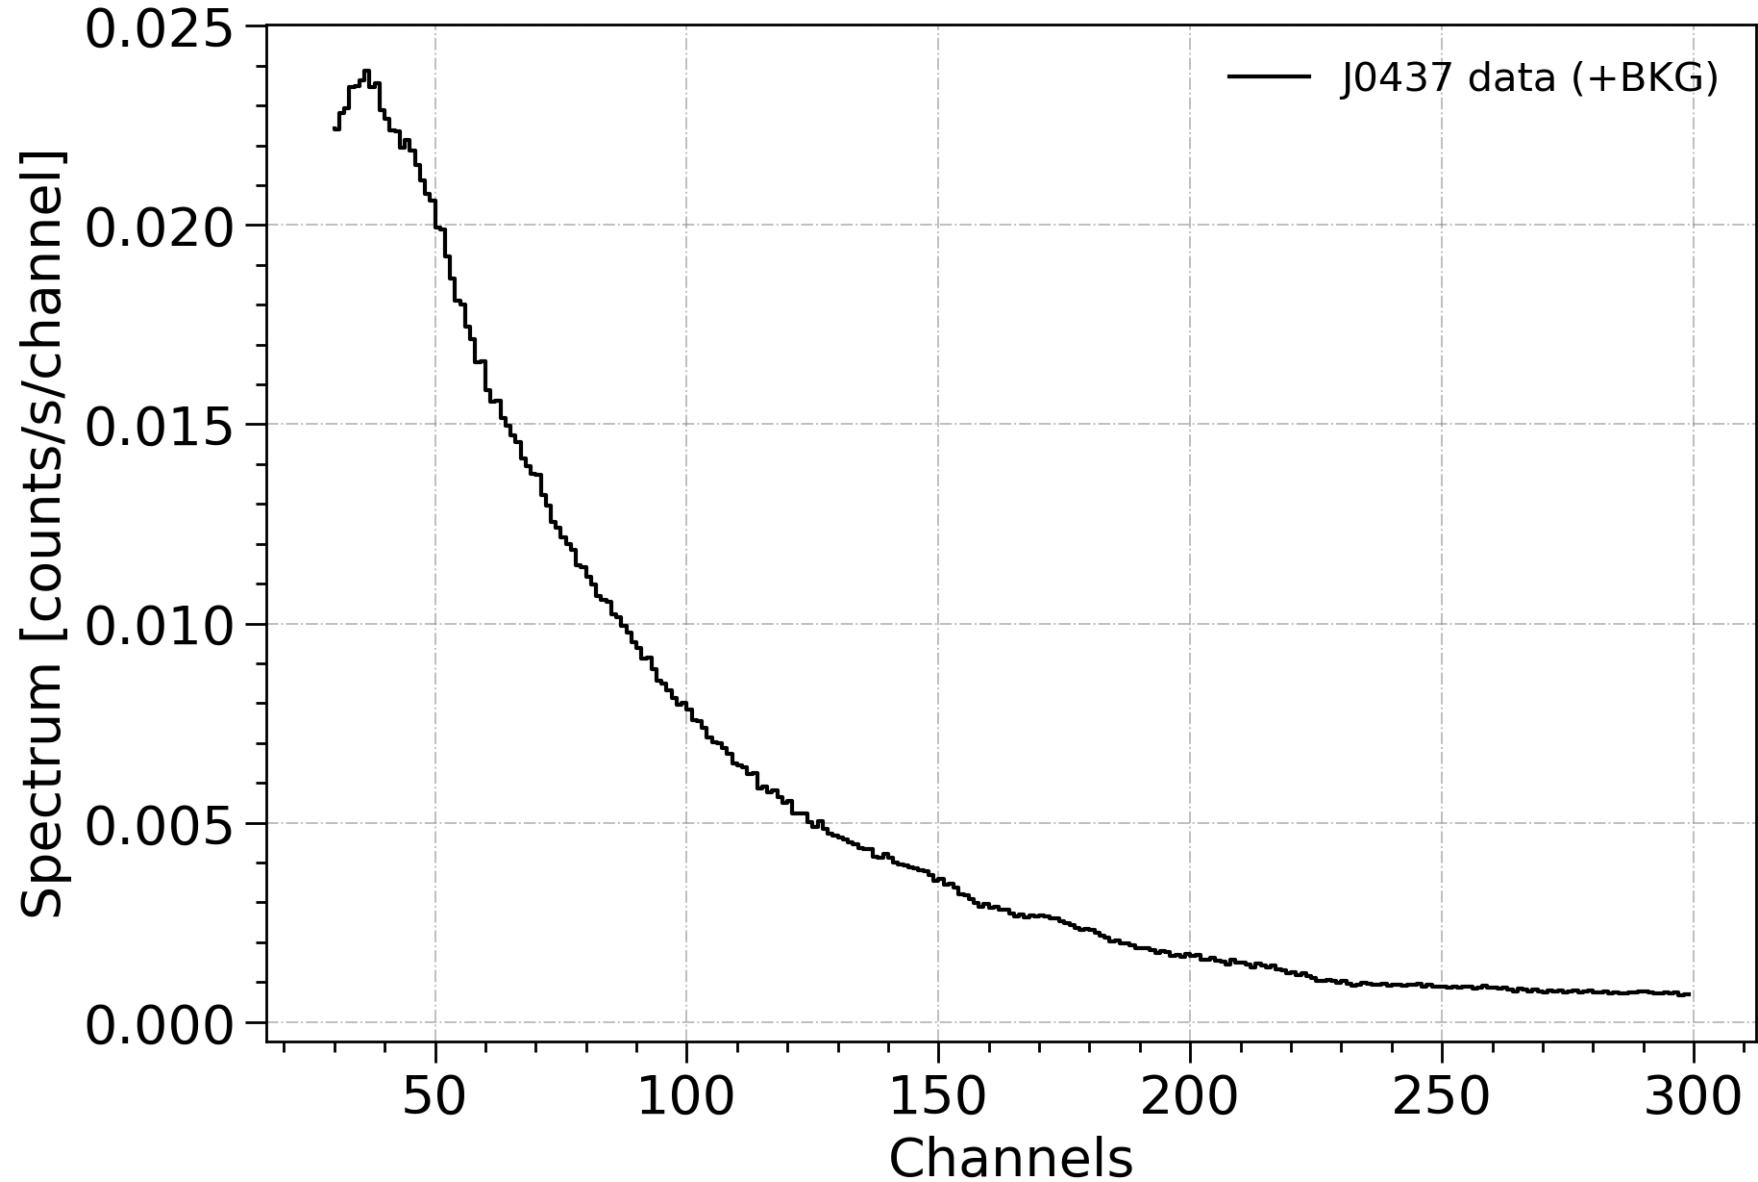

- Observed between 6 Jul 2017 – 12 Mar 2019
- 951 ks of observation
- No BKG constraint
- Noisier data
- ObsID: 0060010101 -> 2060010405

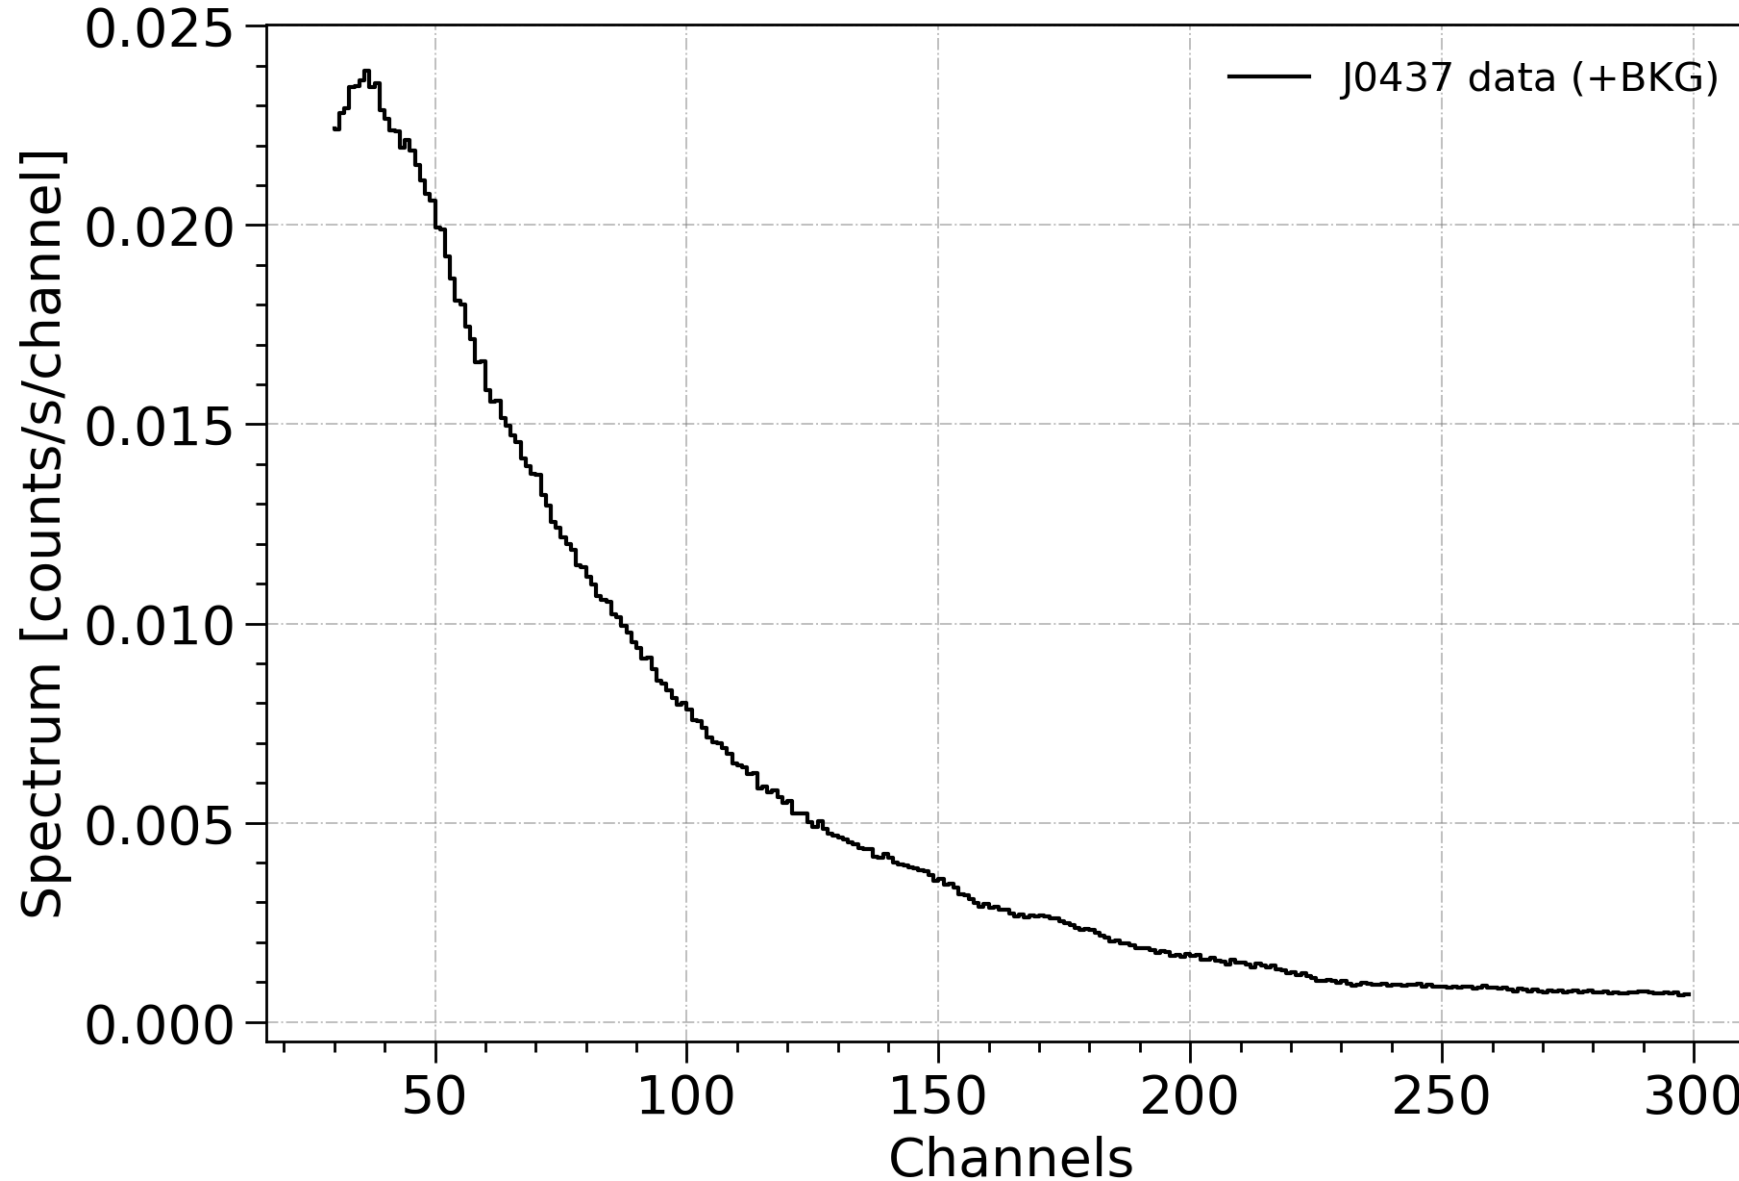

- Observed between 20 Jul 2017 – 11 Oct 2021
- 1.3 Ms of observation
- Provides instrument BKG estimate
- Cleaner data (some loss of source counts)
- ObsID: 1060010104 -> 4060010638

Modelling: Relativistic Ray Tracing

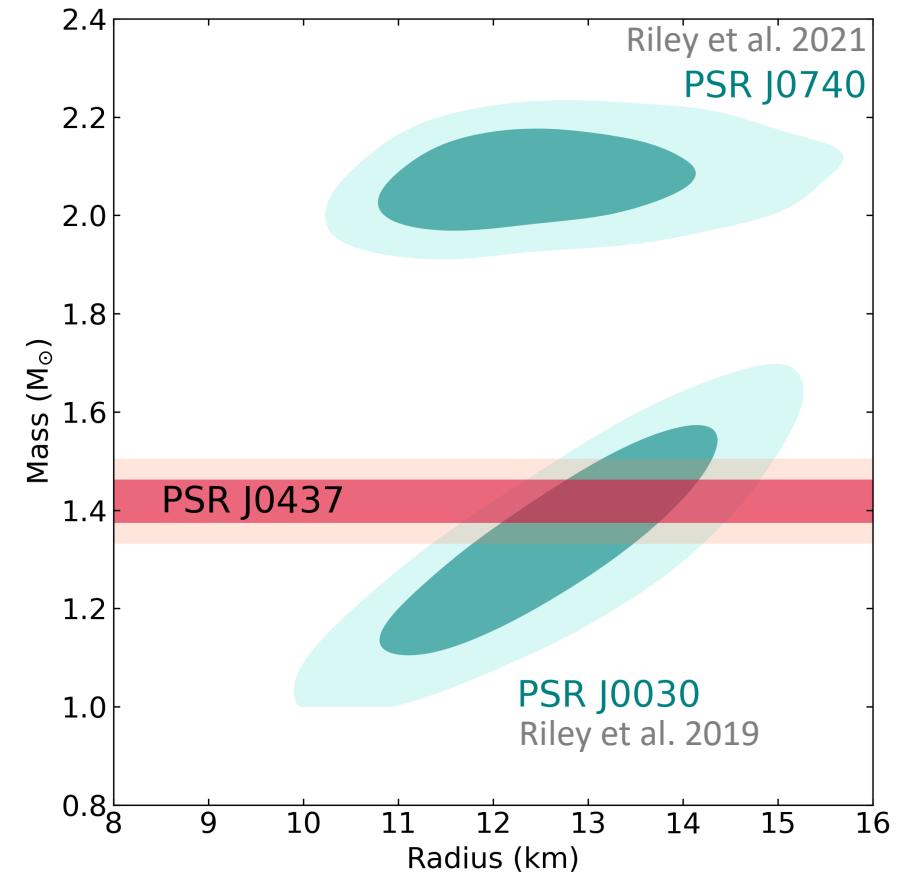

- Oblate Schwarzschild + Doppler approximation (Morsink et al. 2007)

Modelling: Relativistic Ray Tracing

- Oblate Schwarzschild + Doppler approximation (Morsink et al. 2007)
- Radio priors from Parkes Pulsar Timing Array (PPTA-DR4, Reardon et. al. in prep):
 - $M = 1.418 \pm 0.044 M_{\odot}$
 - $i = 137.506 \pm 0.016$ degrees
 - $D = 156.98 \pm 0.16$ pc

J0437 Spot Model (ST-S)

- Spot locations: Antipodal
- Temperature and size: Identical

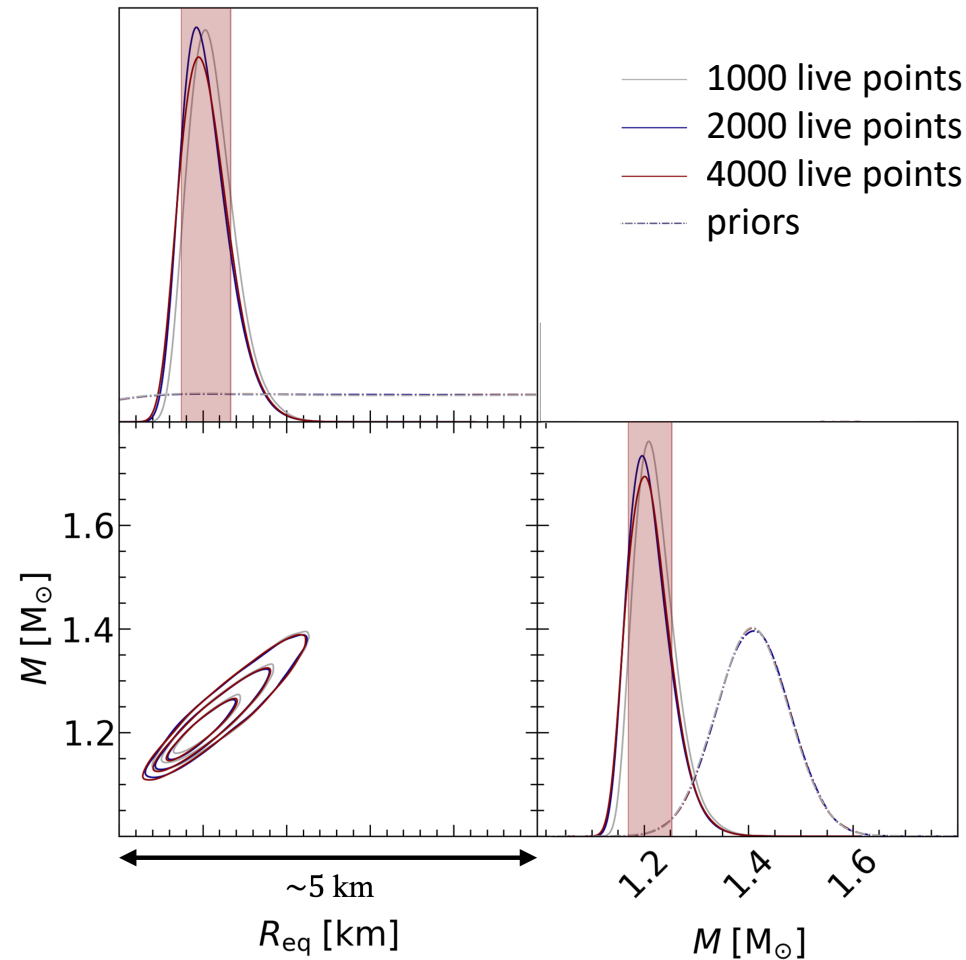

ST-S Results on J0437: Inferred parameters

- Tight radius constraint
- Mass not recovered

ST-S Results on J0437: Model performance

- Tight radius constraint
- Mass not recovered
- Prominent residual structure – can't explain data

J0437 Spot Model (ST-U)

- Spot locations: Independent
- Temperature and size: Non-identical

ST-U
(Single-temperature with
unshared parameters)

■ \mathcal{T}_p
■ \mathcal{T}_s

Riley et al. 2019

ST-U results on J0437: Inferred parameters

- Mass recovered only in the absence of upper limit

ST-U results on J0437: Free BKG model performance

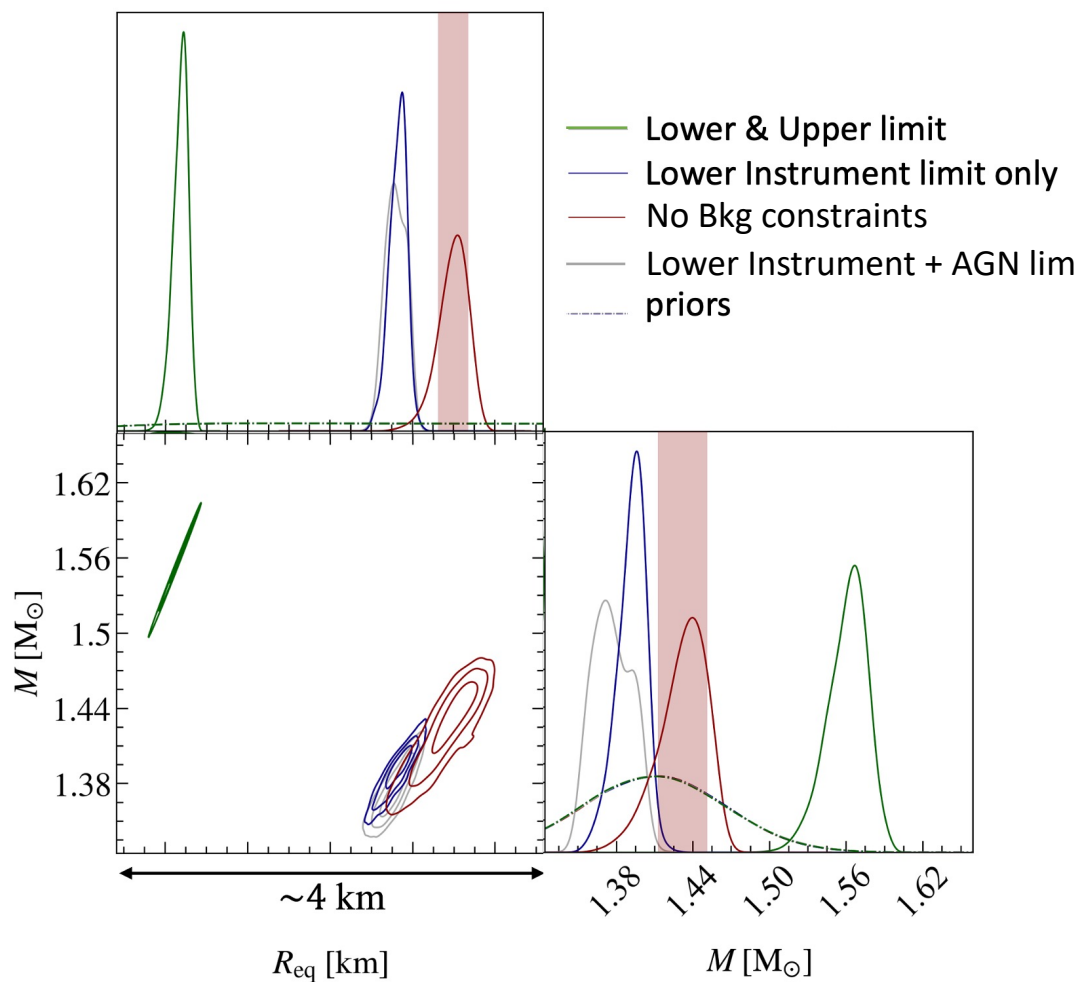

- Mass recovered only in the absence of upper limit
- Fairly good residuals in the absence of upper limits

Free BKG model

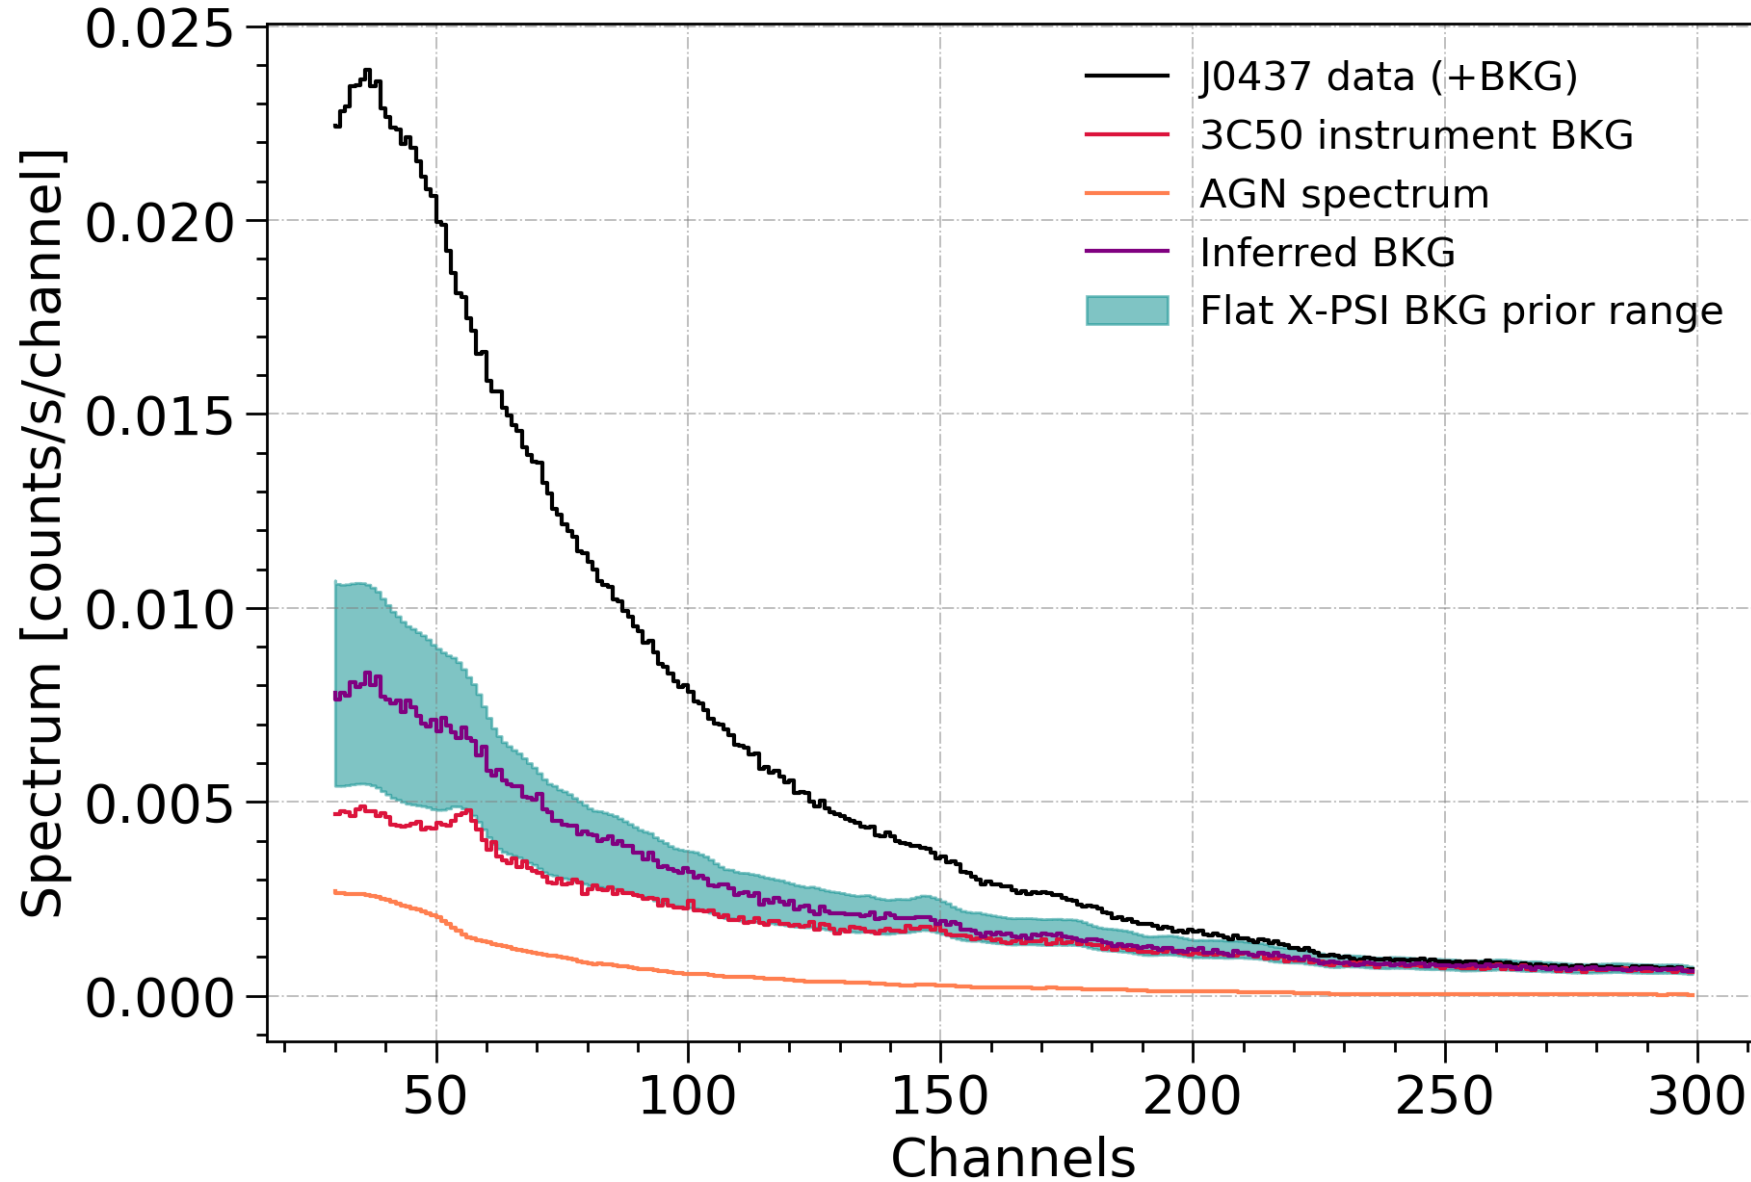

ST-U Results on J0437: Constrained BKG model performance

- Mass recovered only in the absence of upper limit
- Fairly good residuals in the absence of upper limits
- Prominent residuals in the presence of upper limits – deficient model

Lower & upper BKG constrained model

ST-U inferred BKG with lower and upper constraints

ST-U inferred BKG with no constraints

Current Best Models & Radius Constraint Level

- Good news! We have models that work! (Including IM group)
 - Involve more complex geometries
 - Data explained with and without upper BKG constraints
 - Radii consistent for different BKG constraint impositions
 - Better max. likelihood outputs and evidences
- Runs without radio priors tested
 - Radio priors are vital for J0437
- Joint fits with XMM consistent
- Current best model: $\pm 6\%$ radius constraint
