

Global Analysis of TSSAs: Transversity, Nucleon Tensor Charges, and the Role of Lattice QCD

Daniel Pitonyak

Lebanon Valley College, Annville, PA, USA

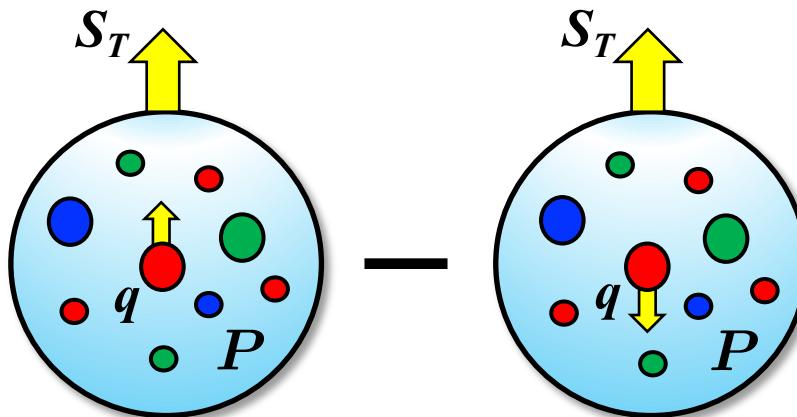

INT Workshop on Inverse Problems and
Uncertainty Quantification in Nuclear Physics

Seattle, WA

July 9, 2024

$$S_T^i \ h_1^q(x) = \frac{1}{2} \int \frac{d\xi^-}{2\pi} e^{ixP^+\xi^-} \text{Tr}[\langle P, S | \bar{\psi}_q(0) \mathcal{W}(0, \xi^-) \psi_q(\xi^-) i\sigma^{i+} \gamma_5 | P, S \rangle]$$

transversity PDF - universal parton density that quantifies the degree of transverse polarization of quarks within a transversely polarized nucleon

$$\delta q \equiv \int_0^1 dx [h_1^q(x) - h_1^{\bar{q}}(x)]$$

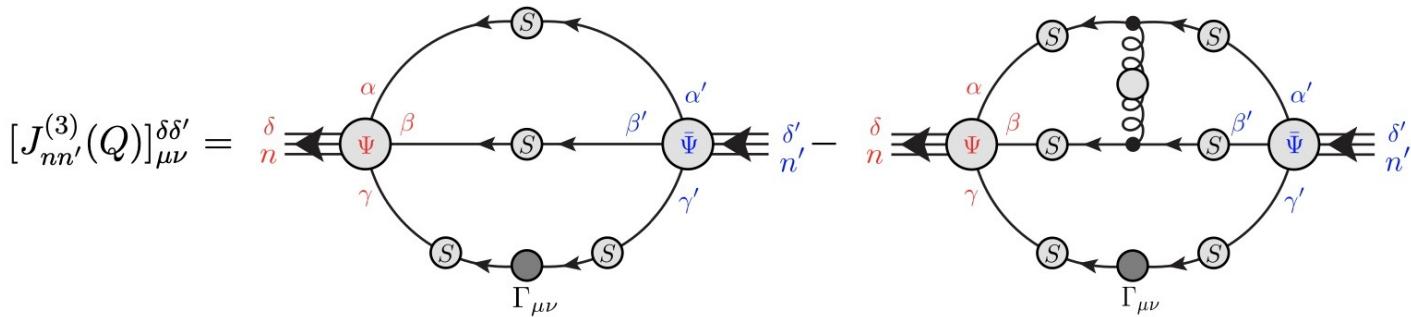

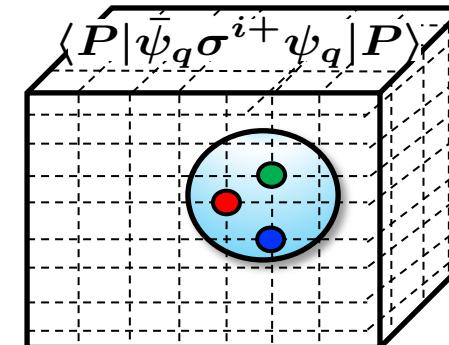

tensor charge for an individual flavor

$$g_T \equiv \delta u - \delta d$$

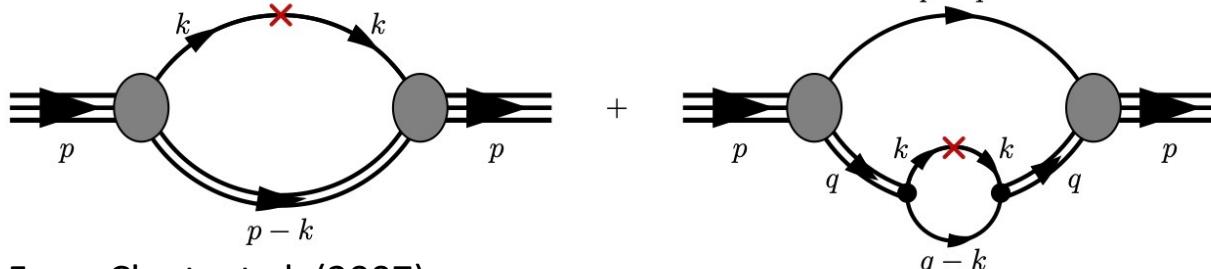

isovector combination

$$\langle P | \bar{\psi}_q \sigma^{i+} \psi_q | P \rangle = \delta q [\bar{u}_P \sigma^{i+} u_P]$$

local matrix element - can be computed in lattice QCD as well as other approaches like Dyson-Schwinger equations and several other models

From Wang, et al. (2018)

From Cloet, et al. (2007)

➤ Importance of the nucleon tensor charge:

- Like the scalar, vector, and axial charges, it is a fundamental charge of the nucleon (although scale dependent)
- Since helicity PDF \neq transversity PDF in relativistic quantum mechanics, it can be considered a measure of relativistic effects in the nucleon
- Key point of comparison between QCD phenomenology/experiment and lattice QCD as well as model calculations
- Needed in certain beyond the Standard Model studies (e.g., beta decay, EDM)

$$\mathcal{L}_{n \rightarrow p e \bar{\nu}_e} \sim \dots + 4\sqrt{2}G_F V_{ud} \mathbf{g_T} \epsilon_T \bar{p} \sigma^{\mu\nu} n \bar{e} \sigma_{\mu\nu} \nu_e + \dots$$

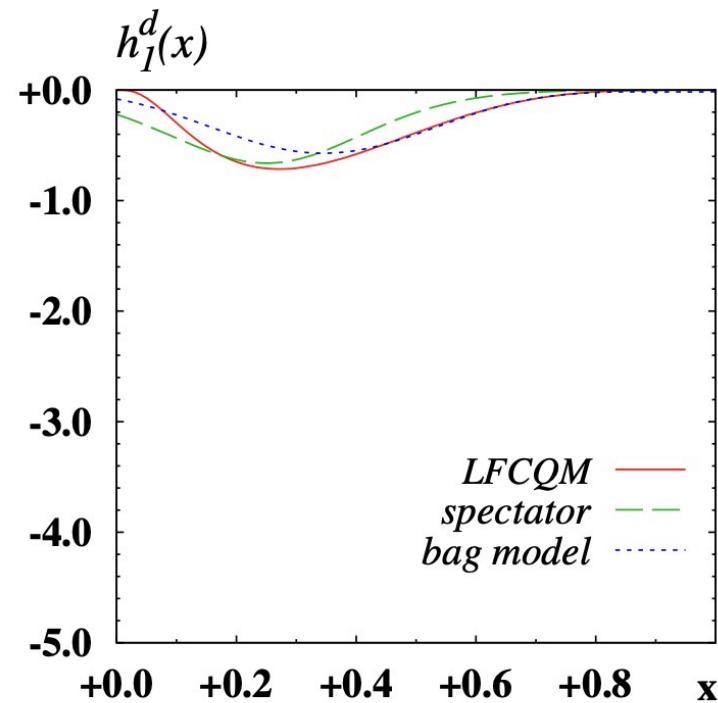

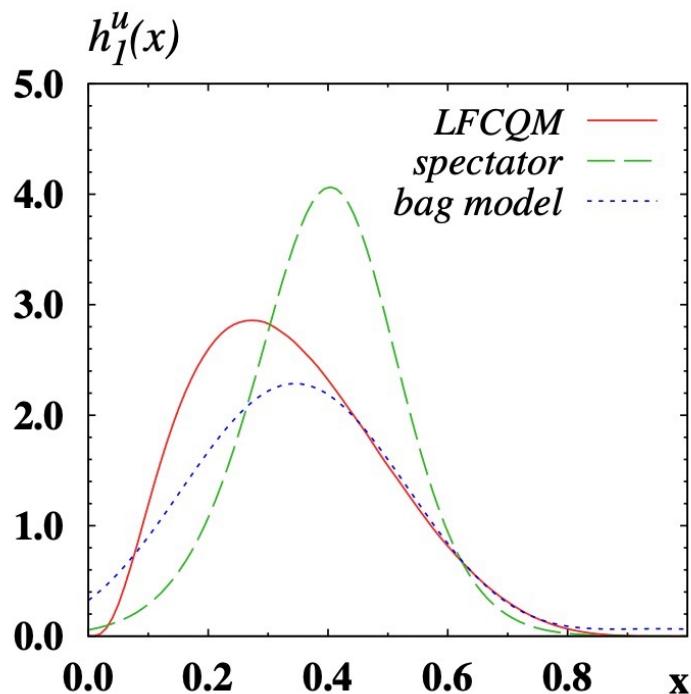

A diagram showing the Lagrangian for neutron beta decay, $\mathcal{L}_{n \rightarrow p e \bar{\nu}_e}$, which includes terms involving the Fermi coupling constant G_F , the Cabibbo-Kobayashi-Maskawa matrix element V_{ud} , and the tensor coupling $\mathbf{g_T} \epsilon_T$. Arrows point from the term $4\sqrt{2}G_F V_{ud} \mathbf{g_T} \epsilon_T$ to the text "Lagrangian for neutron beta decay" and to the text "BSM coupling".

$$\tilde{d}_p = \tilde{d}_u \delta \mathbf{u} + \tilde{d}_d \delta \mathbf{d}$$

A diagram showing the decomposition of the proton EDM, \tilde{d}_p , into the sum of the up quark EDM, $\tilde{d}_u \delta \mathbf{u}$, and the down quark EDM, $\tilde{d}_d \delta \mathbf{d}$. Arrows point from the terms $\tilde{d}_u \delta \mathbf{u}$ and $\tilde{d}_d \delta \mathbf{d}$ to the text "proton EDM" and "quark EDMs" respectively.

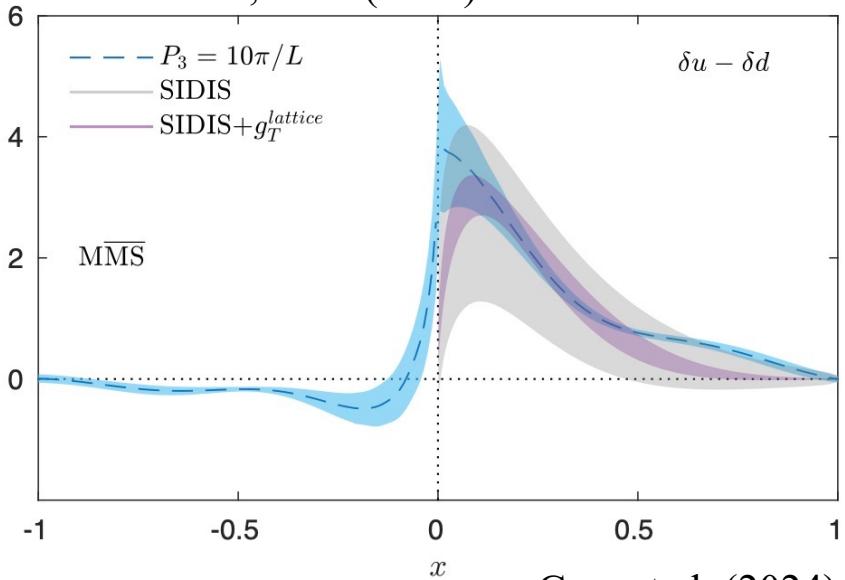

- Model calculations have provided valuable insight into the behavior of $h_1(x)$ we should expect from phenomenology

From the “TMD Handbook” – Pasquini, et al. (2008) - LFCQM; Jakob, et al. (1997) - spectator; Avakian, et al. (2010) - bag model

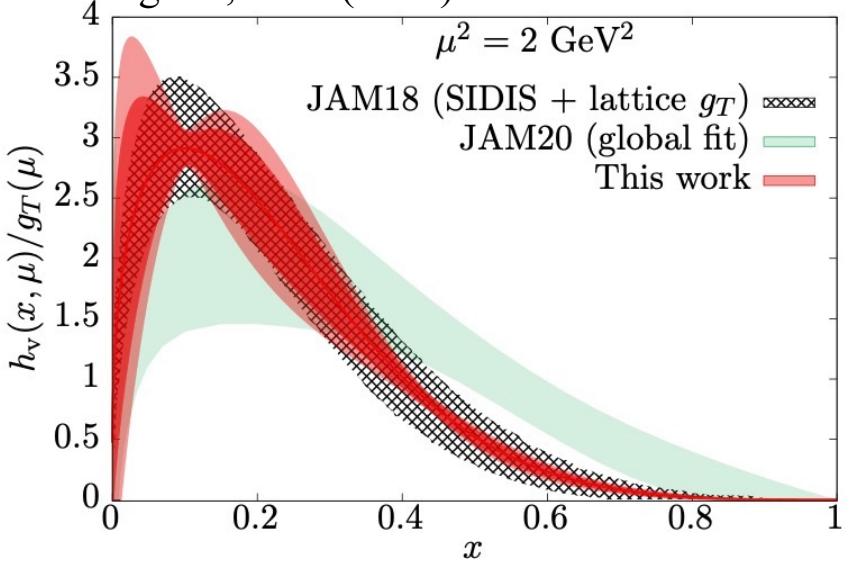

- Lattice QCD also has the ability now to compute $h_1(x)$

Kang, et al. (2016); ...)

$$e^+ e^- \rightarrow h_1 h_2 X$$

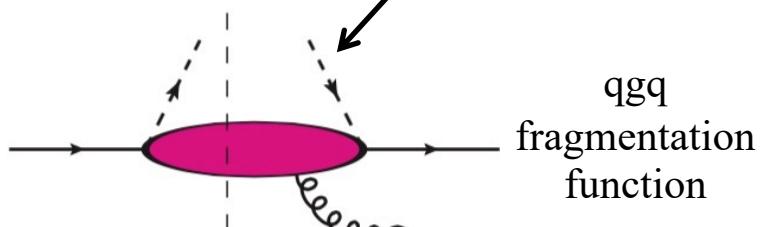

$$F_{UT}^{\sin(\phi_h + \phi_S)} = \mathcal{C} \left[-\frac{\hat{h} \cdot \vec{p}_\perp}{M_h} h_1 \textcolor{blue}{H}_1^\perp \right] \quad F_{UU}^{\cos(2\phi_0)} = \mathcal{C} \left[\frac{2\hat{h} \cdot \vec{p}_{a\perp} \hat{h} \cdot \vec{p}_{b\perp} - \vec{p}_{a\perp} \cdot \vec{p}_{b\perp}}{M_a M_b} \textcolor{blue}{H}_1^\perp \bar{H}_1^\perp \right]$$

TMD/Collins-Soper-Sterman (CSS) Evolution

$$\tilde{h}_1(x, b_T; Q^2, \mu_Q) \sim \text{OPE} \quad h_1(x; \mu_{b_*}) \exp \left[-S_{pert}(b_*(b_T); \mu_{b_*}, Q, \mu_Q) - S_{NP}^{h_1}(b_T, Q) \right]$$

$$\tilde{H}_1^{\perp(1)}(z, b_T; Q^2, \mu_Q) \sim \text{Sudakov exponentials (gluon radiation)} \quad \textcolor{blue}{H}_1^{\perp(1)}(z; \mu_{b_*}) \exp \left[-S_{pert}(b_*(b_T); \mu_{b_*}, Q, \mu_Q) - S_{NP}^{H_1^\perp}(b_T, Q) \right]$$

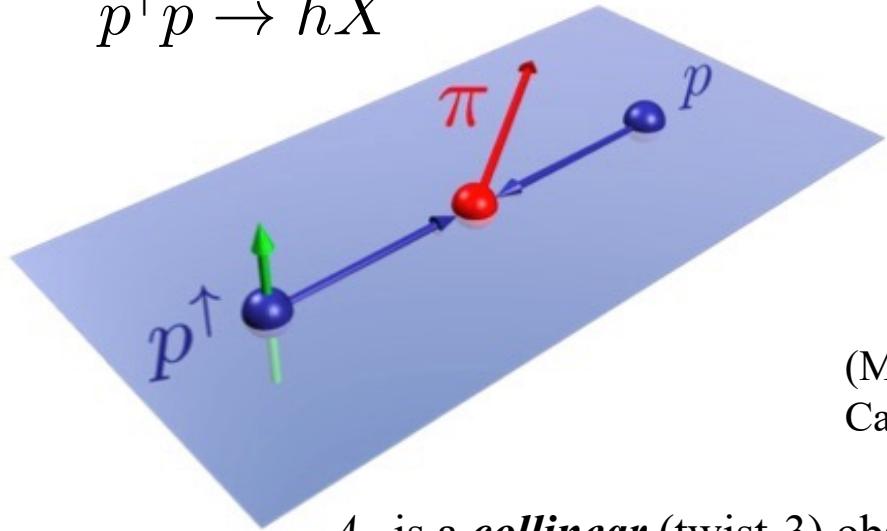

qgq
fragmentation
function

Parton model

$$h_1(x) = \int d^2 \vec{k}_T h_1(x, \vec{k}_T^2)$$

$$H_1^{\perp(1)}(z) = z^2 \int d^2 \vec{p}_\perp \frac{p_\perp^2}{2M_h^2} H_1^\perp(z, z^2 p_\perp^2)_8$$

$$p^\uparrow p \rightarrow hX$$

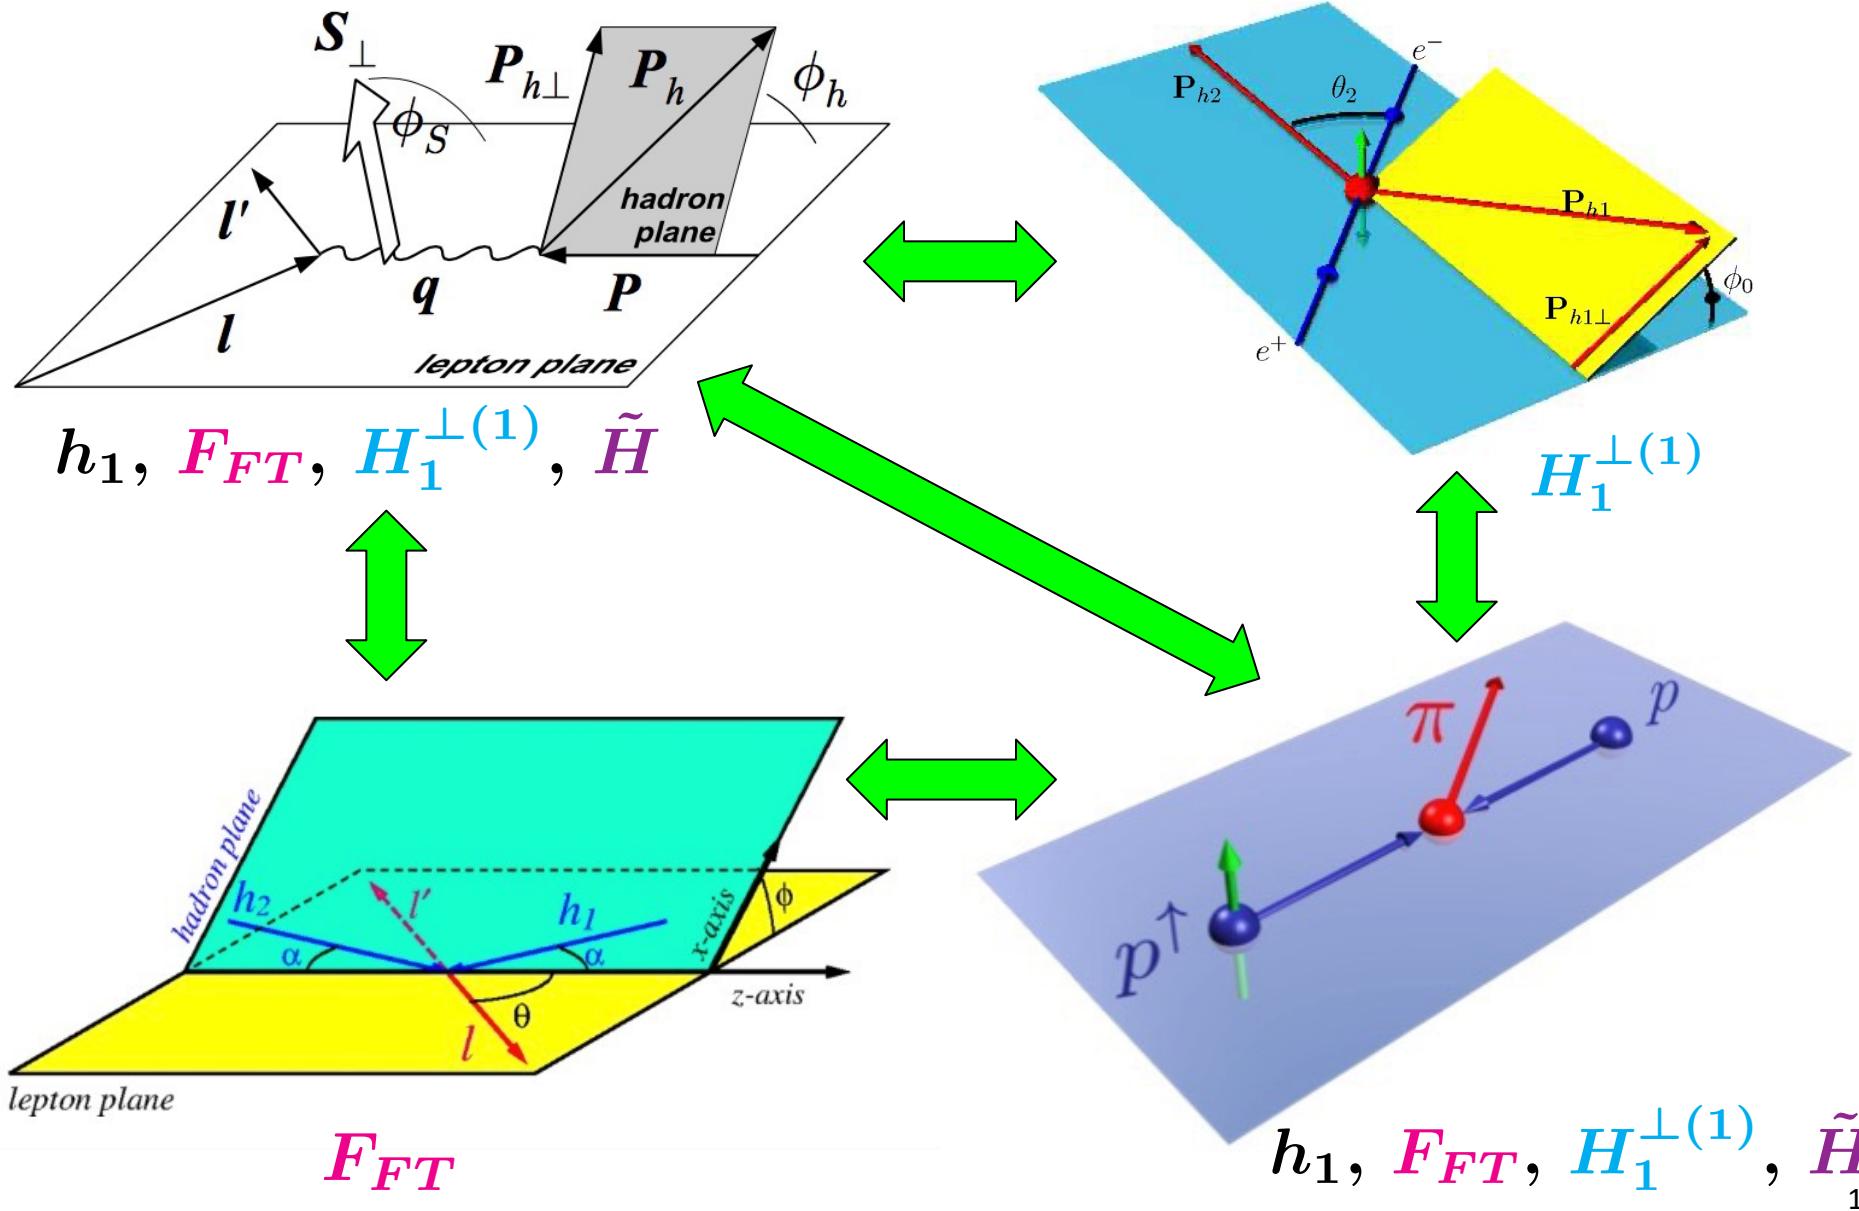

$$d\Delta\sigma(S_T) \sim \underbrace{H_{QS} \otimes f_1 \otimes \mathbf{F}_{FFT} \otimes D_1}_{\text{Qiu-Sterman term}}$$

$$+ \underbrace{H_F \otimes f_1 \otimes \mathbf{h}_1 \otimes (\mathbf{H}_1^{\perp(1)}, \tilde{\mathbf{H}})}_{\text{Fragmentation term}}$$

(Metz, DP (2012); Kanazawa, et al. (2014);
Cammarota, et al. (2020); Gamberg, et al. (2017, 2022))

A_N is a *collinear* (twist-3) observable

- Analyze TSSAs in SIDIS, Drell-Yan, e^+e^- annihilation, and proton-proton collisions and extract

$$h_1(x), F_{FT}(x, x), H_1^{\perp(1)}(z), \tilde{H}(z)$$

along with the relevant transverse momentum widths for the Sivers, transversity, and Collins functions: $\langle k_T^2 \rangle_{f_{1T}^\perp}$, $\langle k_T^2 \rangle_{h_1}$, $\langle p_\perp^2 \rangle_{H_1^\perp}^{fav}$, $\langle p_\perp^2 \rangle_{H_1^\perp}^{unf}$

- We use a Gaussian ansatz: $F^q(x, k_T^2) \sim F^q(x) e^{-k_T^2 / \langle k_T^2 \rangle}$ where

$$F^q(x) = \frac{N_q x^{a_q} (1-x)^{b_q} (1 + \gamma_q x^{\alpha_q} (1-x)^{\beta_q})}{B[a_q+2, b_q+1] + \gamma_q B[a_q+\alpha_q+2, b_q+\beta_q+1]}$$

NB: $\{\gamma, \alpha, \beta\}$ only used for $H_1^{\perp(1)}(x)$, $b_u = b_d$ for $h_1(x)$, $f_{1T}^{\perp(1)}(x)$

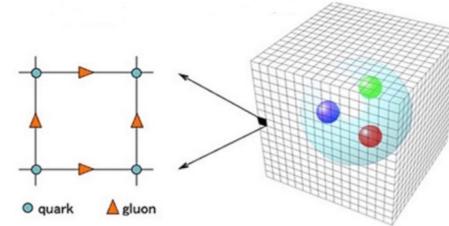

- DGLAP-type evolution for the collinear functions analogous to Duke & Owens (1984): double-log Q^2 -dependent term explicitly added to the parameters

- Additional data/constraints included in the fit compared to 2020:
 - Collins and Sivers effects (3D-binned) SIDIS data from HERMES (2020)
 - $A_{UT}^{\sin \phi_S}$ data (x and z projections only) from HERMES (2020)

$$\int d^2\vec{P}_{hT} F_{UT}^{\sin \phi_S} = -\frac{x}{z} \sum_q e_q^2 \frac{2M_h}{Q} h_1^{q/N}(x) \tilde{H}^{h/q}(z)$$

- Lattice data on g_T at the physical pion mass from ETMC (Alexandrou, et al. (2019))

- Imposing the Soffer bound on transversity: $|h_1^q(x)| \leq \frac{1}{2}(f_1^q(x) + g_1^q(x))$

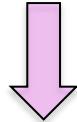

Generate “data” (central value and $1-\sigma$ uncertainty) using recent simultaneous fit of f_1 and g_1 from Cocuzza, et al. (2022) and add to the χ^2 if SB is violated by more than the uncertainty in the data

$$\chi^2/N_{\text{pts.}} = 647/634 = 1.02$$

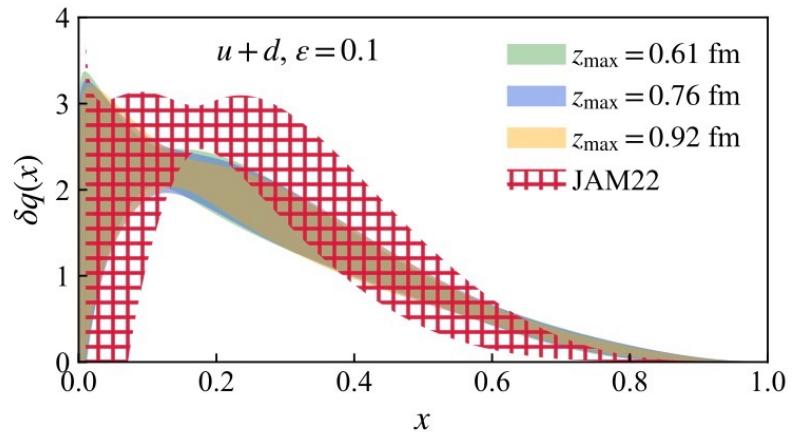

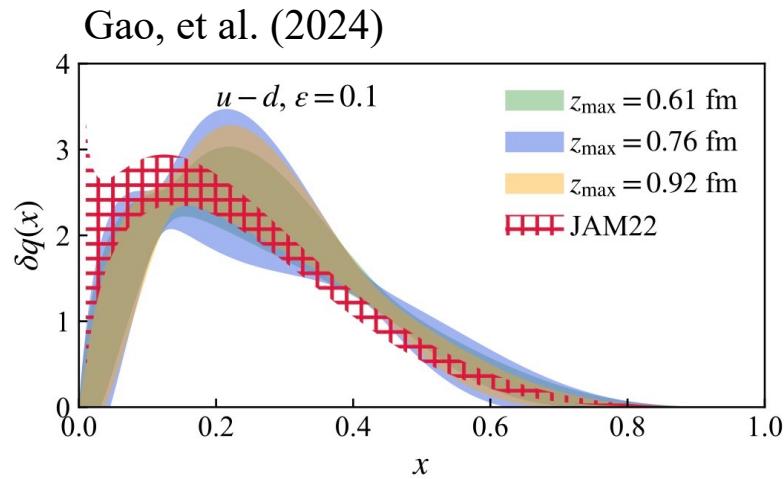

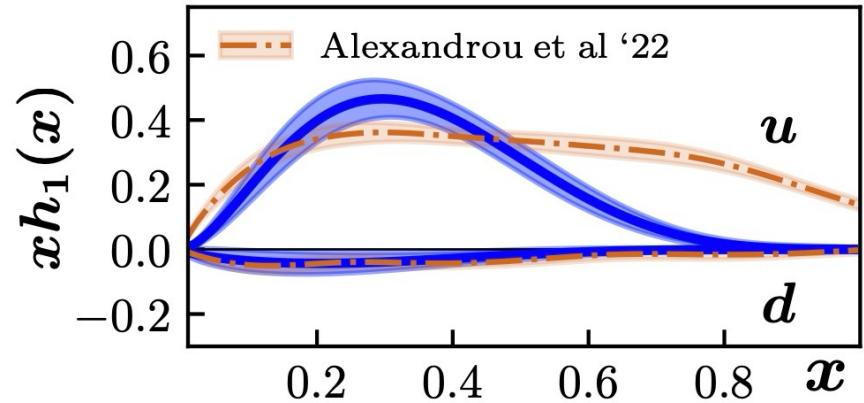

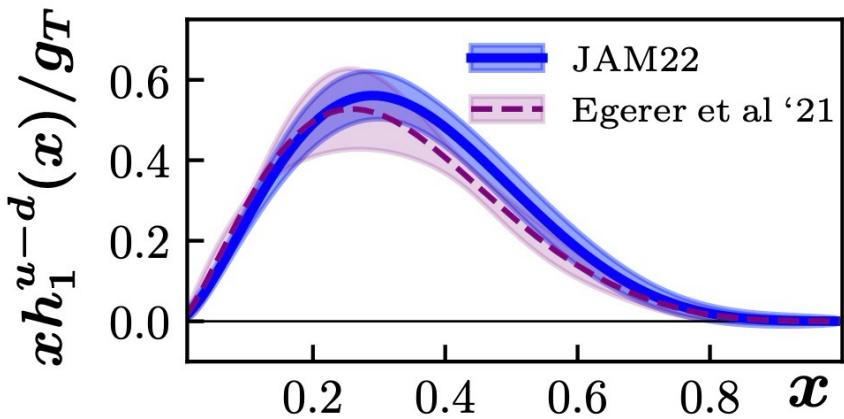

Observable	Reactions	Non-Perturbative Function(s)	χ^2/npts
$A_{UT}^{\sin(\phi_h - \phi_S)}$	$e + (p, d)^\uparrow \rightarrow e + (\pi^+, \pi^-, \pi^0) + X$	$f_{1T}^\perp(x, \vec{k}_T^2)$	$182.9/166 = 1.10$
$A_{UT}^{\sin(\phi_h + \phi_S)}$	$e + (p, d)^\uparrow \rightarrow e + (\pi^+, \pi^-, \pi^0) + X$	$h_1(x, \vec{k}_T^2), H_1^\perp(z, z^2 \vec{p}_T^2)$	$181.0/166 = 1.09$
$*A_{UT}^{\sin \phi_S}$	$e + p^\uparrow \rightarrow e + (\pi^+, \pi^-, \pi^0) + X$	$h_1(x), \tilde{H}(z)$	$18.6/36 = 0.52$
$A_{UC/UL}$	$e^+ + e^- \rightarrow \pi^+ \pi^- (UC, UL) + X$	$H_1^\perp(z, z^2 \vec{p}_T^2)$	$154.9/176 = 0.88$
$A_{T,\mu^+\mu^-}^{\sin \phi_S}$	$\pi^- + p^\uparrow \rightarrow \mu^+ \mu^- + X$	$f_{1T}^\perp(x, \vec{k}_T^2)$	$6.92/12 = 0.58$
$A_N^{W/Z}$	$p^\uparrow + p \rightarrow (W^+, W^-, Z) + X$	$f_{1T}^\perp(x, \vec{k}_T^2)$	$30.8/17 = 1.81$
A_N^π	$p^\uparrow + p \rightarrow (\pi^+, \pi^-, \pi^0) + X$	$h_1(x), F_{FT}(x, x) = \frac{1}{\pi} f_{1T}^{\perp(1)}(x), H_1^{\perp(1)}(z), \tilde{H}(z)$	$70.4/60 = 1.17$
Lattice g_T	—	$h_1(x)$	$1.82/1 = 1.82$

- TMD that only include e^+e^- and SIDIS Collins effect data (e.g., Kang, et al. (2016), D'Alesio, et al. (2020)) and dihadron analyses (e.g., Radici, Bacchetta (2018); Benel, Courtoy, Ferro-Hernandez (2019)), are generally below the lattice values for g_T and δu
- Note that one initially finds JAM3D-22 has more tension with lattice, but this does *not* imply phenomenology and lattice are incompatible – one can only fully answer this by including lattice data in the analysis (use it as a prior)
- **Once g_T is included (as a Bayesian prior), we find the non-perturbative functions can accommodate it and still describe the experimental data well**

- We find good agreement with lattice calculations of $h_l(x)$

From Bianconi, et al. (2000)

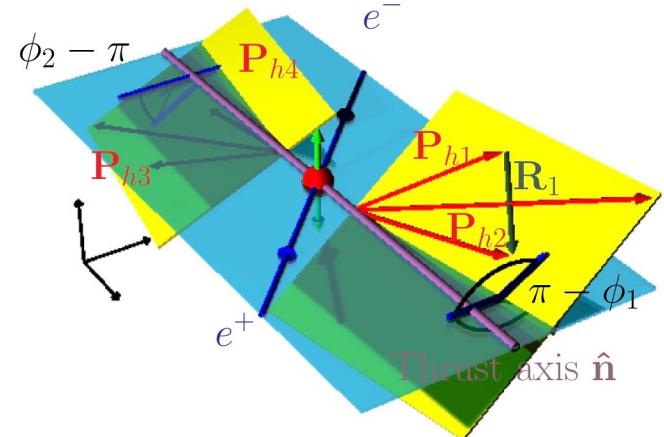

Bianconi, et al. (2000); Bacchetta, Radici (2003, 2004), ...

$$P_h = P_1 + P_2 \quad R = (P_1 - P_2)/2 \quad z = z_1 + z_2 \quad \zeta = (z_1 - z_2)/z$$

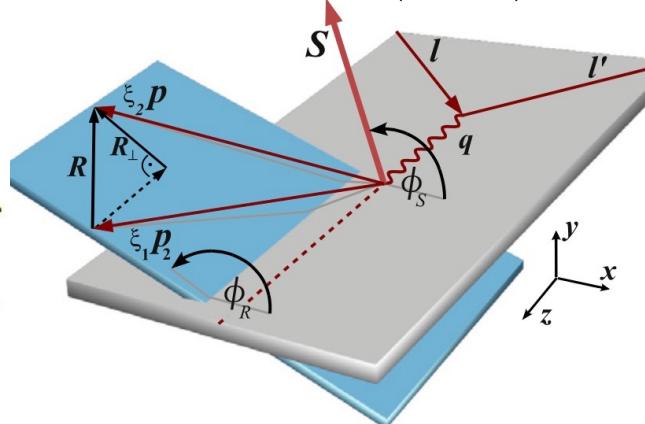

$$P_1 = \left(\frac{M_1^2 + \vec{R}_T^2}{(1 + \zeta)P_h^-}, \frac{1 + \zeta}{2}P_h^-, \vec{R}_T \right) \quad P_2 = \left(\frac{M_2^2 + \vec{R}_T^2}{(1 - \zeta)P_h^-}, \frac{1 - \zeta}{2}P_h^-, -\vec{R}_T \right)$$

$$\vec{R}_T^2 = \frac{1 - \zeta^2}{4}M_h^2 - \frac{1 - \zeta}{2}M_1^2 - \frac{1 + \zeta}{2}M_2^2$$

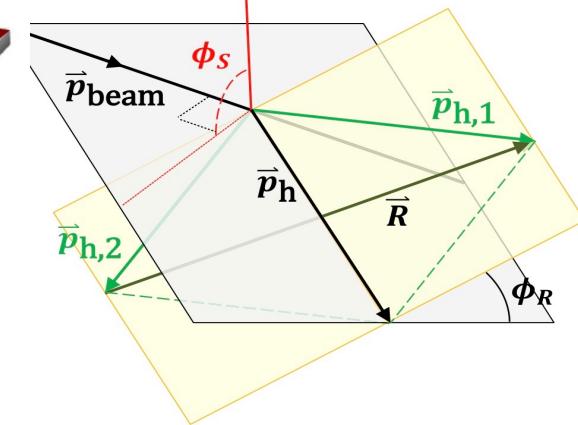

$$e^+ e^- \rightarrow (h_1 h_2) (\bar{h}_1 \bar{h}_2) X$$

$$\ell N^\uparrow \rightarrow \ell (h_1 h_2) X$$

$$p^\uparrow p \rightarrow (h_1 h_2) X$$

(Collins, et al. (1994); Bianconi, et al. (2000); Bacchetta, Radici (2003, 2004); Courtoy, et al. (2012); Matevosyan, et al. (2018); Radici, et al. (2013, 2015, 2018); Benel, et al. (2020), ...)

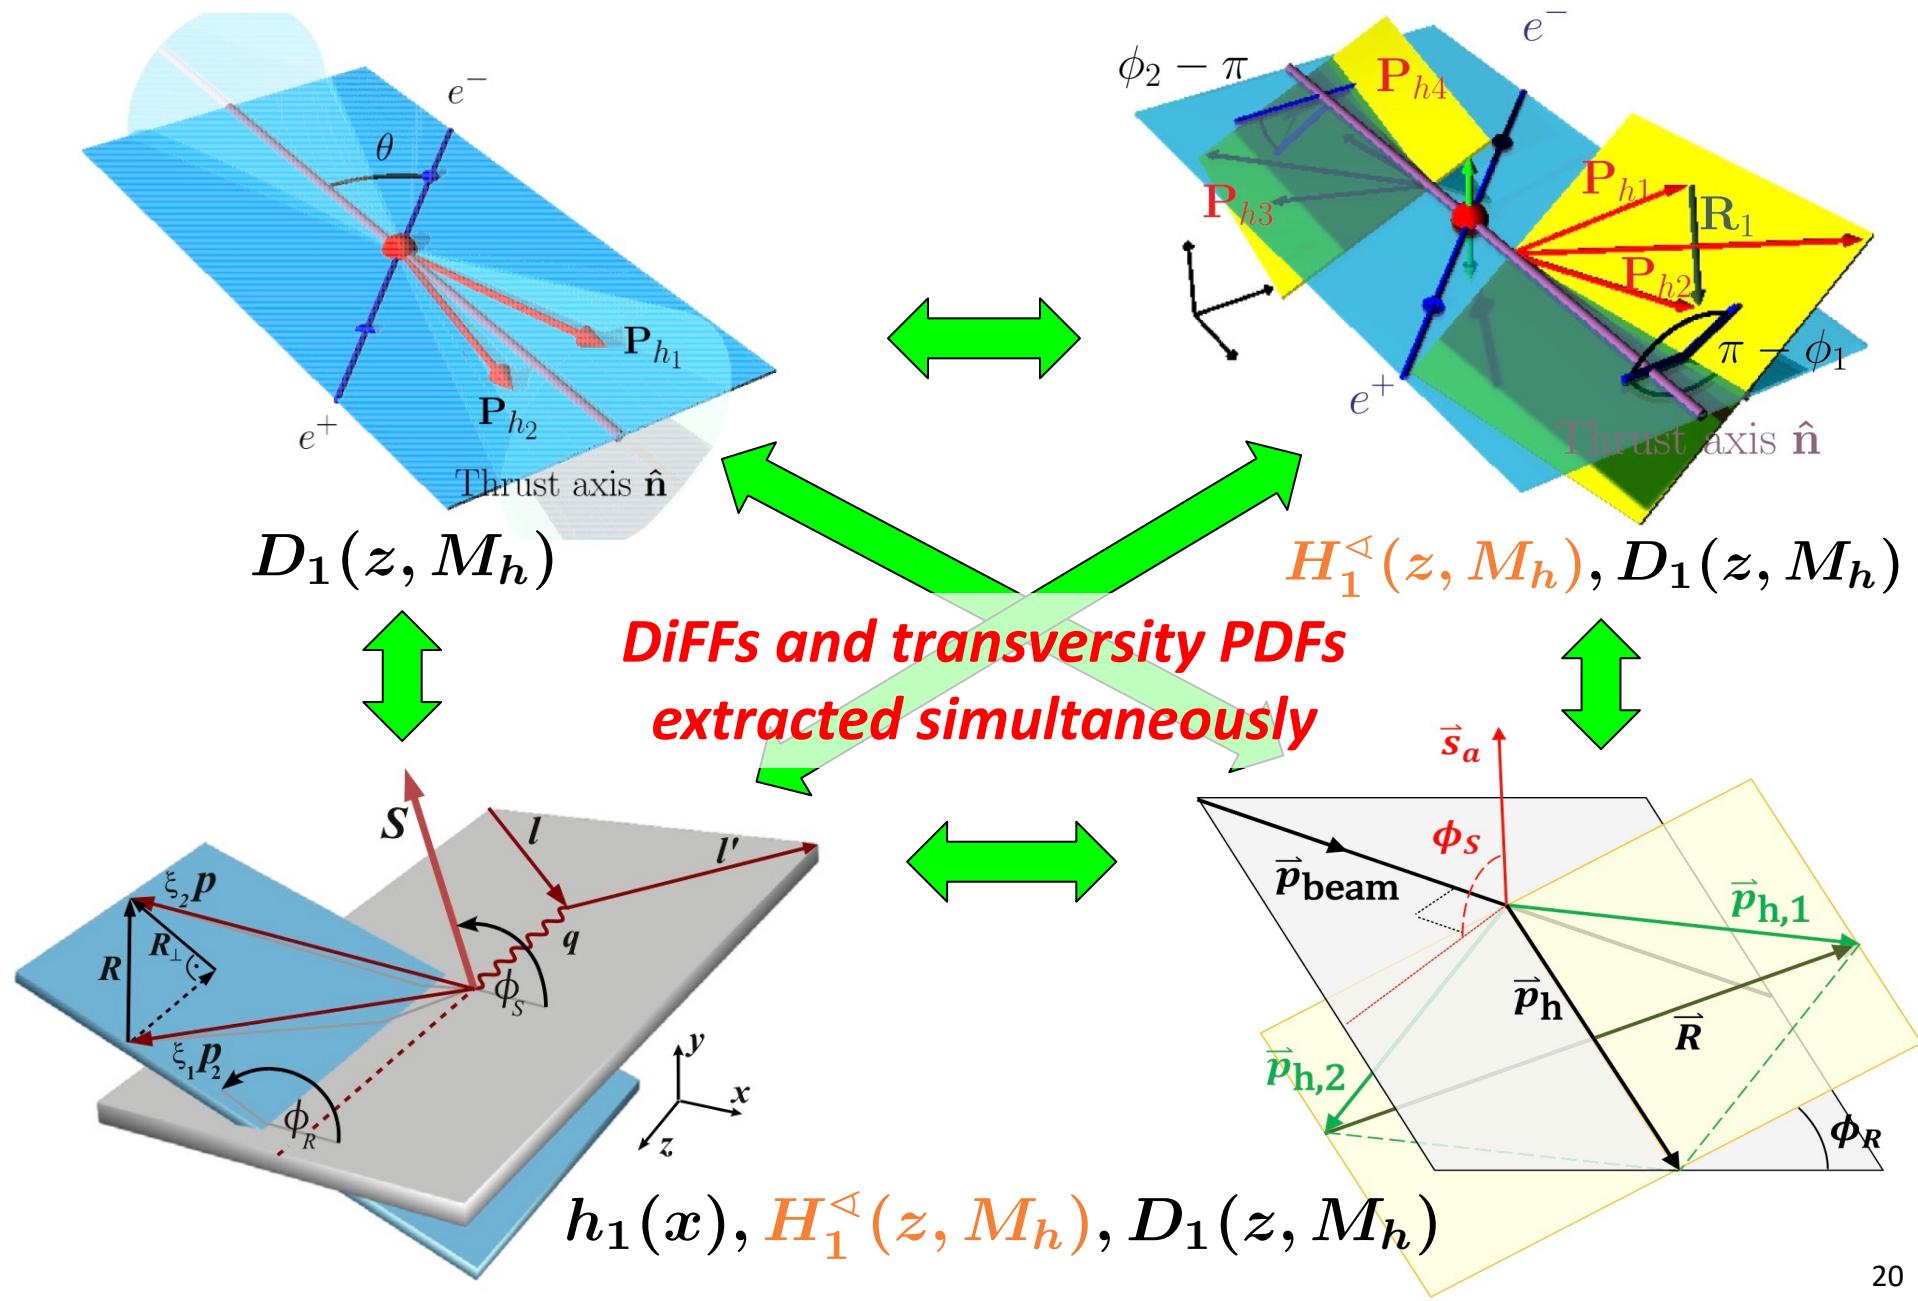

$$a_{12R} = \frac{\sin^2 \theta_2 \sum_q e_q^2 \mathbf{H}_1^{\triangleleft, \mathbf{q}}(z, M_h) \mathbf{H}_1^{\triangleleft, \bar{q}}(\bar{z}, \bar{M}_h)}{(1 + \cos^2 \theta_2) \sum_q e_q^2 \mathbf{D}_1^q(z, M_h) \mathbf{D}_1^{\bar{q}}(\bar{z}, \bar{M}_h)} \xrightarrow{\text{Artru-Collins asymmetry}}$$

$$A_{UT}^{\sin(\phi_R + \phi_S)} = \frac{\sum_q e_q^2 \mathbf{h}_1^q(x) \mathbf{H}_1^{\triangleleft, \mathbf{q}}(z, M_h)}{\sum_q e_q^2 f_1^q(x) \mathbf{D}_1^q(z, M_h)}$$

Note: D_1 can be constrained using data on $d\sigma/dz dM_h$ from BELLE (2017)

$$\frac{d\sigma}{dz dM_h} = \frac{4\pi N_c \alpha_{\text{em}}^2}{3Q^2} \sum_q e_q^2 \mathbf{D}_1^q(z, M_h)$$

$$A_{UT}^{\sin(\phi_R - \phi_S)} \sim \frac{\frac{d\Delta\hat{\sigma}_{a \uparrow b \rightarrow c \uparrow}}{d\hat{t}} \otimes \mathbf{h}_1^a(x_a) \otimes f_1^b(x_b) \otimes \mathbf{H}_1^{\triangleleft, \mathbf{c}}(z, M_h)}{\frac{d\hat{\sigma}_{ab \rightarrow c}}{d\hat{t}} \otimes f_1^a(x_a) \otimes f_1^b(x_b) \otimes \mathbf{D}_1^c(z, M_h)}$$

➤ Parameterization of the $\pi^+\pi^-$ DiFFs $D_1(z, M_h)$, $H_1^\triangleleft(z, M_h)$

- Symmetry relations (Courtoy, et al. (2012))

$$\begin{aligned} D_1^u = D_1^d = D_1^{\bar{u}} = D_1^{\bar{d}}, \quad & H_1^{\triangleleft,u} = -H_1^{\triangleleft,d} = -H_1^{\triangleleft,\bar{u}} = H_1^{\triangleleft,\bar{d}}, \\ D_1^s = D_1^{\bar{s}}, \quad D_1^c = D_1^{\bar{c}}, \quad D_1^b = D_1^{\bar{b}} \quad & H_1^{\triangleleft,s} = -H_1^{\triangleleft,\bar{s}} = H_1^{\triangleleft,c} = -H_1^{\triangleleft,\bar{c}} = 0 \end{aligned}$$

also have D_1^g

- Positivity bounds (Bacchetta, Radici (2003))

$$D_1(z, M_h) > 0 \quad |H_1^\triangleleft(z, M_h)| < D_1(z, M_h)$$

➤ Parameterization of the $\pi^+\pi^-$ DiFFs $D_1(z, M_h)$, $H_1^\triangleleft(z, M_h)$

- Because of the resonance structure of the e^+e^- cross section, we use a grid in M_h whose density depends on the flavor and DiFF and then at each grid point we have the functional form $\sim Nz^a(1-z)^b$. The grid is then interpolated to give a general M_h dependence. E.g., for the up quark for D_1 ,

$$\mathbf{M}_h^u = [2m_\pi, 0.40, 0.50, 0.70, 0.75, 0.80, 0.90, 1.00, 1.20, 1.30, 1.40, 1.60, 1.80, 2.00] \text{ GeV}$$

$$D_1^u(z, \mathbf{M}_h^{u,i}) = \sum_{j=1,2,3} \frac{N_{ij}^u z^{\alpha_{ij}^u} (1-z)^{\beta_{ij}^u}}{\text{B}[\alpha_{ij}^u + 1, \beta_{ij}^u + 1]}$$

→ 204 parameters for D_1 and 48 parameters for H_1^\triangleleft

➤ Parameterization of the $\pi^+\pi^-$ DiFFs $D_1(z, M_h)$, $H_1^\triangleleft(z, M_h)$

- Because of the resonance structure of the e^+e^- cross section, we use a grid in M_h whose density depends on the flavor and DiFF and then at each grid point we have the functional form $\sim Nz^a(1-z)^b$. The grid is then interpolated to give a general M_h dependence. E.g., for the up quark for D_1 ,

$$\mathbf{M}_h^u = [2m_\pi, 0.40, 0.50, 0.70, 0.75, 0.80, 0.90, 1.00, 1.20, 1.30, 1.40, 1.60, 1.80, 2.00] \text{ GeV}$$

$$D_1^u(z, \mathbf{M}_h^{u,i}) = \sum_{j=1,2,3} \frac{N_{ij}^u z^{\alpha_{ij}^u} (1-z)^{\beta_{ij}^u}}{\text{B}[\alpha_{ij}^u + 1, \beta_{ij}^u + 1]}$$

→ 204 parameters for D_1 and 48 parameters for H_1^\triangleleft

- The Belle data is not sufficient to perform a flavor separation for D_1 , so we supplement with data from PYTHIA for σ^q/σ^{tot} for $q = s, c, b$ at $\sqrt{s} = [10.58, 30.73, 50.88, 71.04, 91.19] \text{ GeV}$ using different tunes to quantify systematic uncertainties
→ constrain D_1 for s, c, b as well as the gluon (through scaling violations)

➤ Parameterization of $h_1(x)$

- We use the following functional form for the transversity PDFs u_ν , d_ν , and $\bar{u} = -\bar{d}$ (from large- N_c limit (Pobylitsa (2003))) and impose the Soffer bound

$$F(x) = \frac{Nx^\alpha(1-x)^\beta(1+\gamma\sqrt{x}+\delta x)}{B[\alpha+1, \beta+1] + \gamma B[\alpha + \frac{3}{2}, \beta+1] + \delta B[\alpha+2, \beta+1]}$$

→ 15 parameters for h_1

➤ Parameterization of $h_1(x)$

- We use the following functional form for the transversity PDFs u_v , d_v , and $\bar{u} = -\bar{d}$ (from large- N_c limit (Pobylitsa (2003))) and impose the Soffer bound

$$F(x) = \frac{N x^\alpha (1-x)^\beta (1 + \gamma \sqrt{x} + \delta x)}{B[\alpha+1, \beta+1] + \gamma B[\alpha + \frac{3}{2}, \beta+1] + \delta B[\alpha+2, \beta+1]}$$

Use constraint from small- x
asymptotics (Kovchegov, Sievert (2019))

$$\alpha \xrightarrow{x \rightarrow 0} 1 - 2 \sqrt{\frac{\alpha_s N_c}{2\pi}} \longrightarrow \alpha = 0.170 \pm 0.085$$

50% uncertainty due to unaccounted for
 $1/N_c$ and NLO corrections

➤ Parameterization of $h_1(x)$

- We use the following functional form for the transversity PDFs u_ν , d_ν , and $\bar{u} = -\bar{d}$ (from large- N_c limit (Pobylitsa (2003))) and impose the Soffer bound

$$F(x) = \frac{Nx^\alpha(1-x)^\beta(1+\gamma\sqrt{x}+\delta x)}{B[\alpha+1, \beta+1] + \gamma B[\alpha + \frac{3}{2}, \beta+1] + \delta B[\alpha+2, \beta+1]}$$

→ 15 parameters for h_1

- Perform the analysis with and without LQCD data **as a Bayesian prior** for the tensor charges δu , δd from ETMC (Alexandrou, et al. (2019)) and PNDME (Gupta, et al. (2018)) (physical pion mass and 2+1+1 flavors)

- Remark about χ^2 definition and Bayesian priors

$$\mathcal{P}(\mathbf{a}|\text{data}) \propto \mathcal{L}(\mathbf{a}, \text{data}) \pi(\mathbf{a}) \quad \mathcal{L}(\mathbf{a}, \text{data}) = \exp\left(-\frac{1}{2}\chi^2(\mathbf{a}, \text{data})\right)$$

$$\chi^2(\mathbf{a}) = \sum_{e,i} \left(\frac{d_{e,i} - \sum_k r_{e,k} \beta_{e,i}^k - T_{e,i}(\mathbf{a})/N_e}{\alpha_{e,i}} \right)^2$$

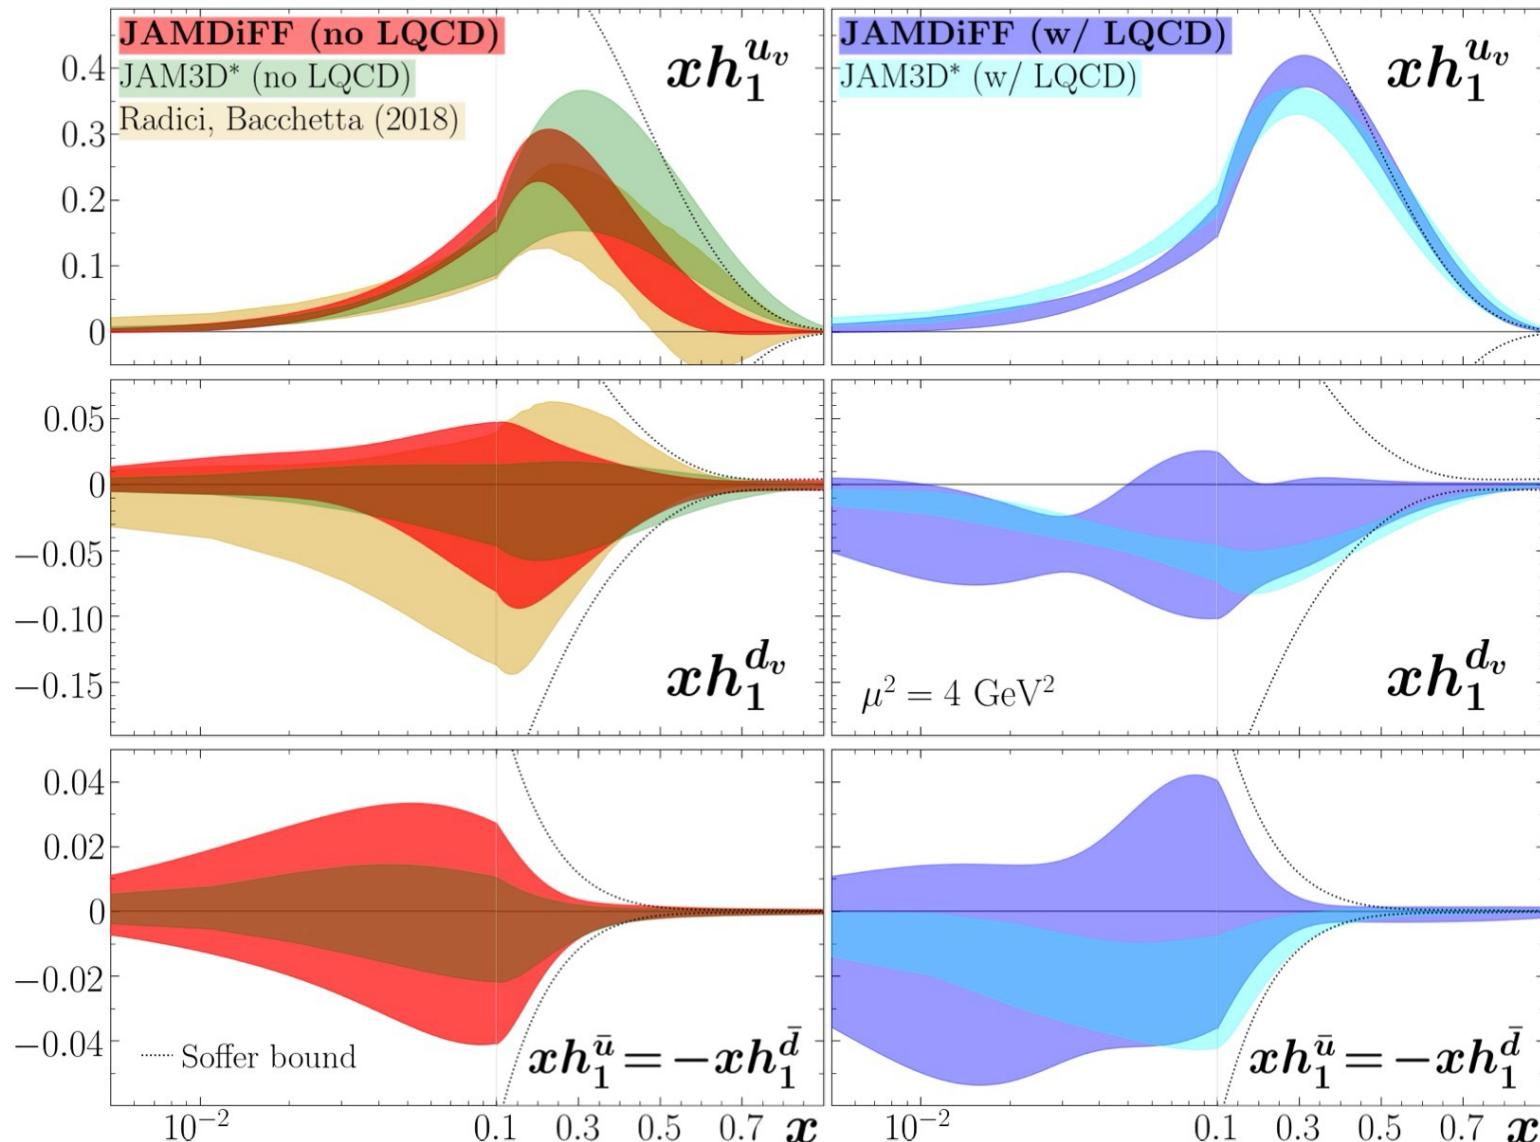

Only experimental data included in
the χ^2 function (no LQCD)

$$\begin{aligned} \pi(\mathbf{a}) &= \prod_l \Theta((a_l - a_l^{\min})(a_l^{\max} - a_l)) \prod_f \prod_i \exp \left\{ -\frac{1}{2} \left(\frac{d_{f,i} - T_{f,i}(\mathbf{a})}{\alpha_{f,i}} \right)^2 \right\} \\ &\times \prod_e \prod_k \exp \left\{ -\frac{1}{2} r_{e,k}^2 \right\} \prod_e \exp \left\{ -\frac{1}{2} \left(\frac{1 - N_e}{\delta N_e} \right)^2 \right\} \exp \left\{ -\frac{1}{2} \Delta_{D_1 < 0}^2 \right\} \exp \left\{ -\frac{1}{2} \Delta_{|H_1^\triangleleft| > D_1}^2 \right\} \exp \left\{ -\frac{1}{2} \Delta_{\text{SB}}^2 \right\} \end{aligned}$$

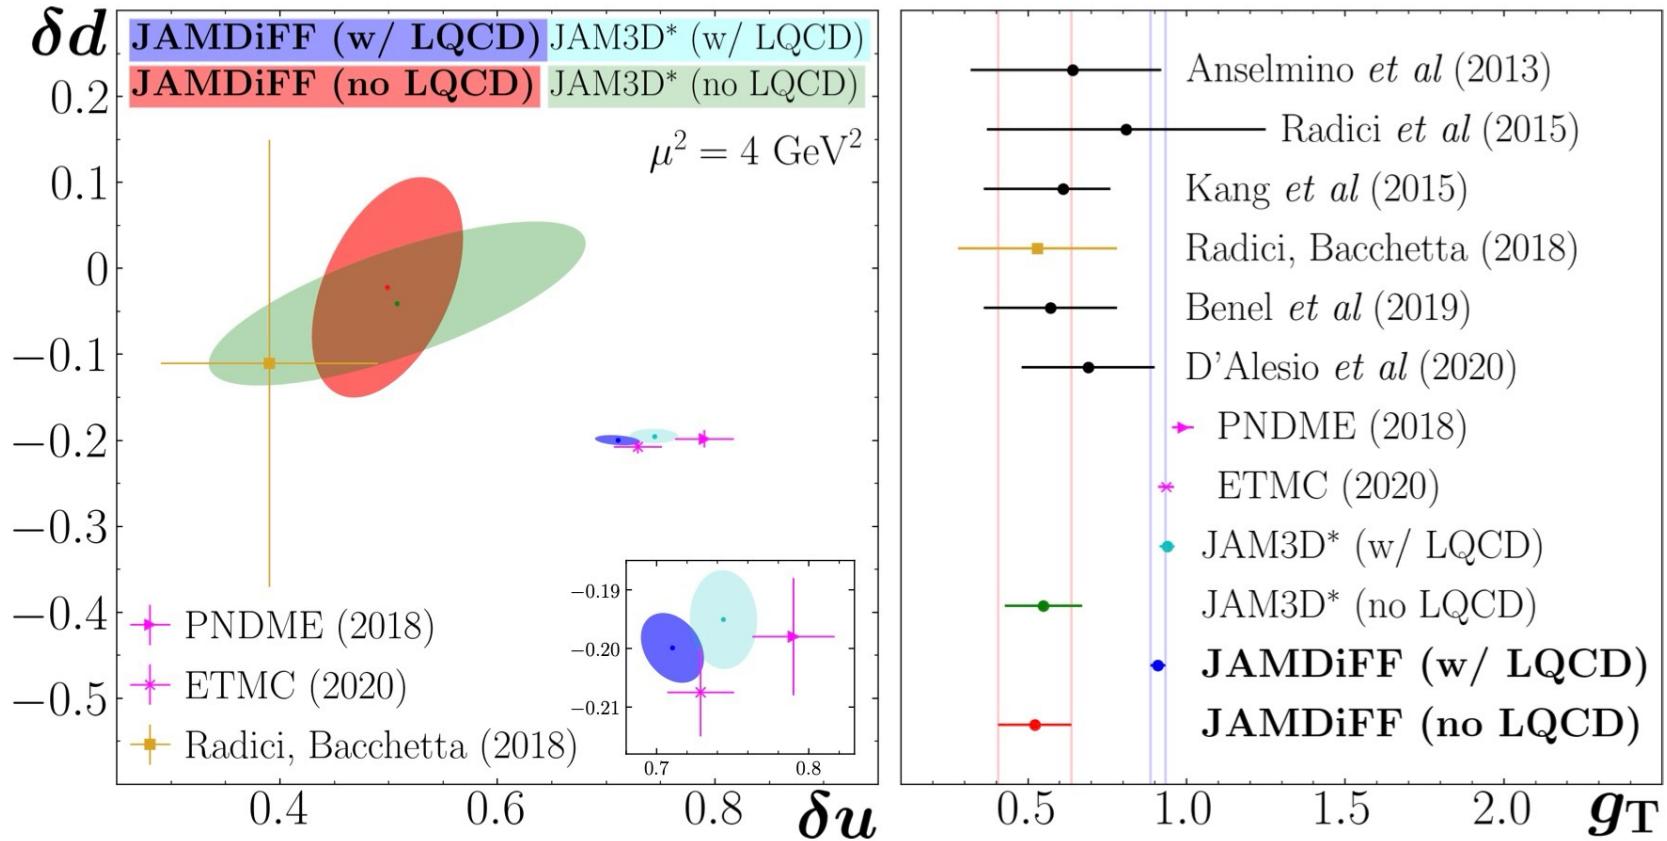

LQCD data
included as a prior

Note: JAM3D* is slightly modified from the published JAM3D-22 version: antiquarks are now included (with $\bar{u} = -\bar{d}$), $\delta u, \delta d$ from ETMC and PNDME are both included in the fit, and small- x constraint is imposed

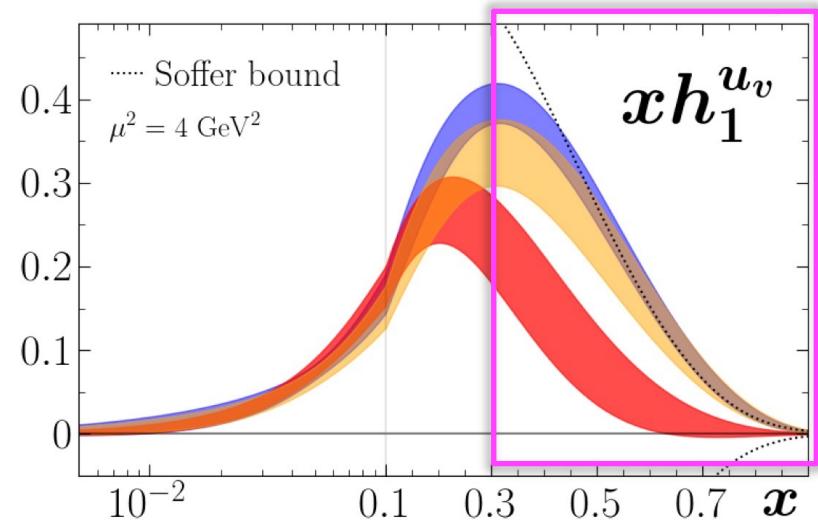

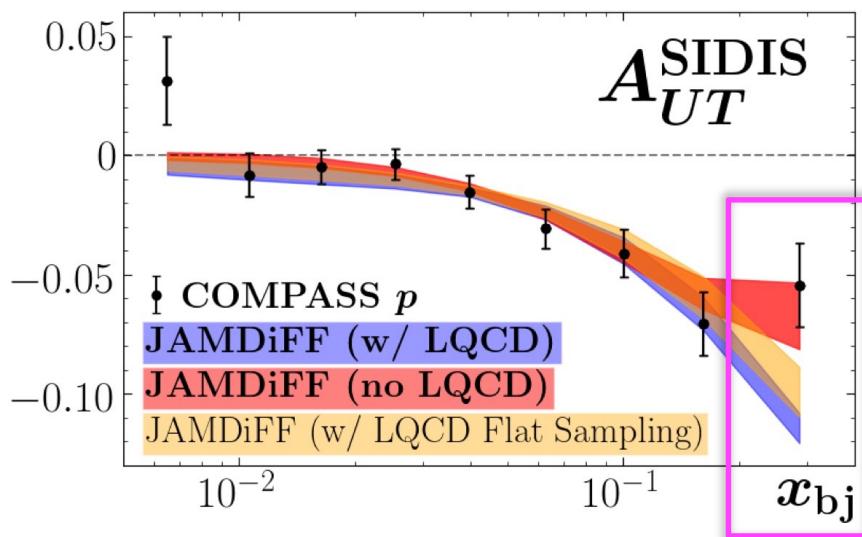

- JAMDiFF (no LQCD) agrees within errors with JAM3D* (no LQCD) and Radici, Bacchetta (2018) for the tensor charges
- Similar to the JAM3D analysis, **JAMDiFF also finds compatibility with lattice once that data is included in the fit (as a Bayesian prior), and can still describe the experimental data well**

- Possible explanation for the shift ($\sim 3\text{-}4\sigma$ difference to a $\sim 0.3\text{-}2\sigma$ difference) in the phenomenological values of the tensor charges once LQCD data is used as a prior:

- In the no LQCD fit, $h_{I^{uv}}$ has a maximum and then begins to decrease around where the x coverage of the experimental data ends ($x \approx 0.3$)
- Within our parameterization, the PDFs fall off smoothly and monotonically as $x \rightarrow 1$, and this drives the behavior (and uncertainty) of $h_{I^{uv}}$ in the unmeasured ($x > 0.3$) region
- The fit with LQCD included has additional constraints at larger x due to the fact that one integrates from $x \in [0, 1]$ to calculate the tensor charges. This causes $h_{I^{uv}}$ to now peak at slightly higher $x \approx 0.35$ in order to accommodate both LQCD and experimental data.
- The Soffer bound forces the with LQCD $h_{I^{uv}}$ to then decrease shortly after $x = 0.35$ and the PDF again falls off smoothly and monotonically as $x \rightarrow 1$

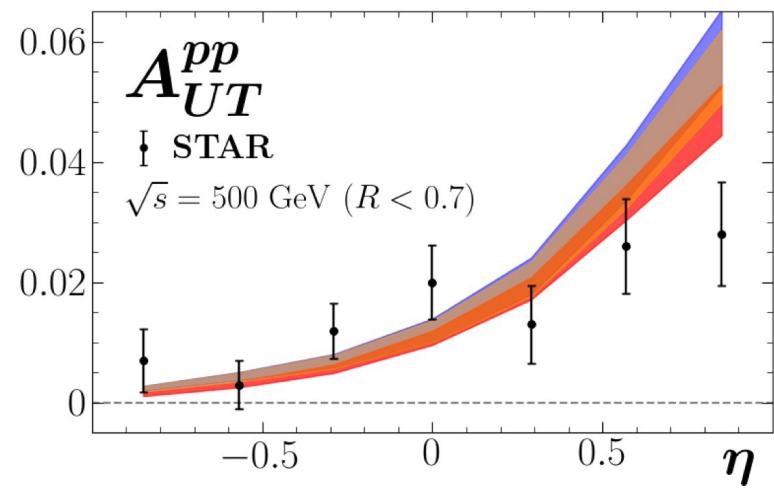

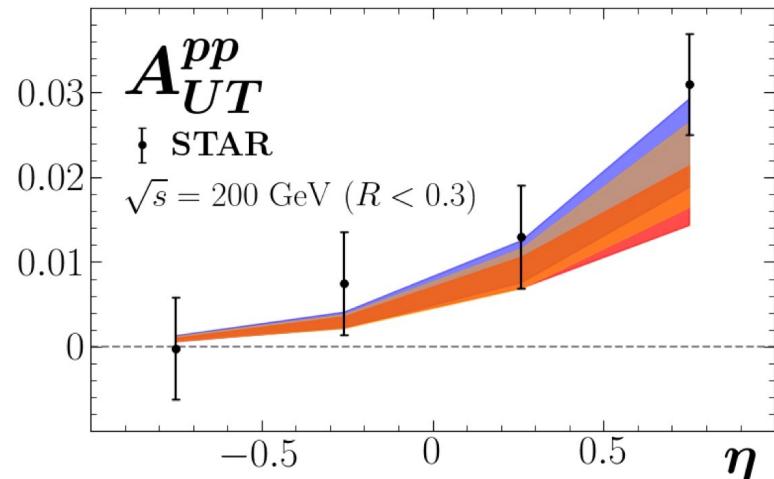

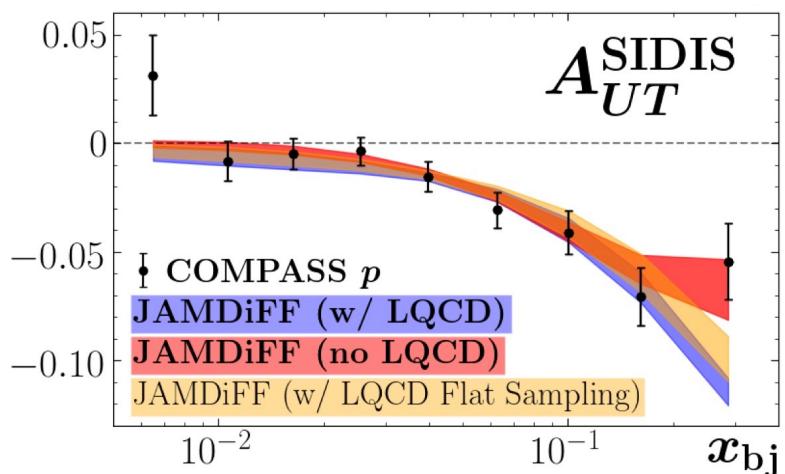

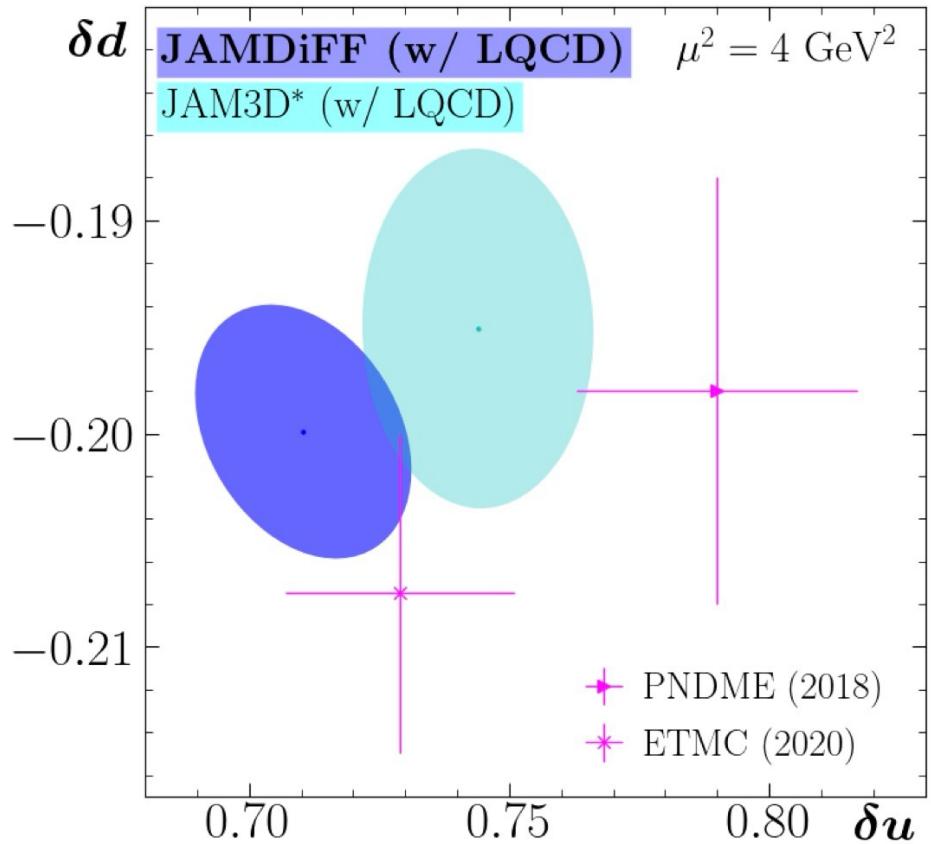

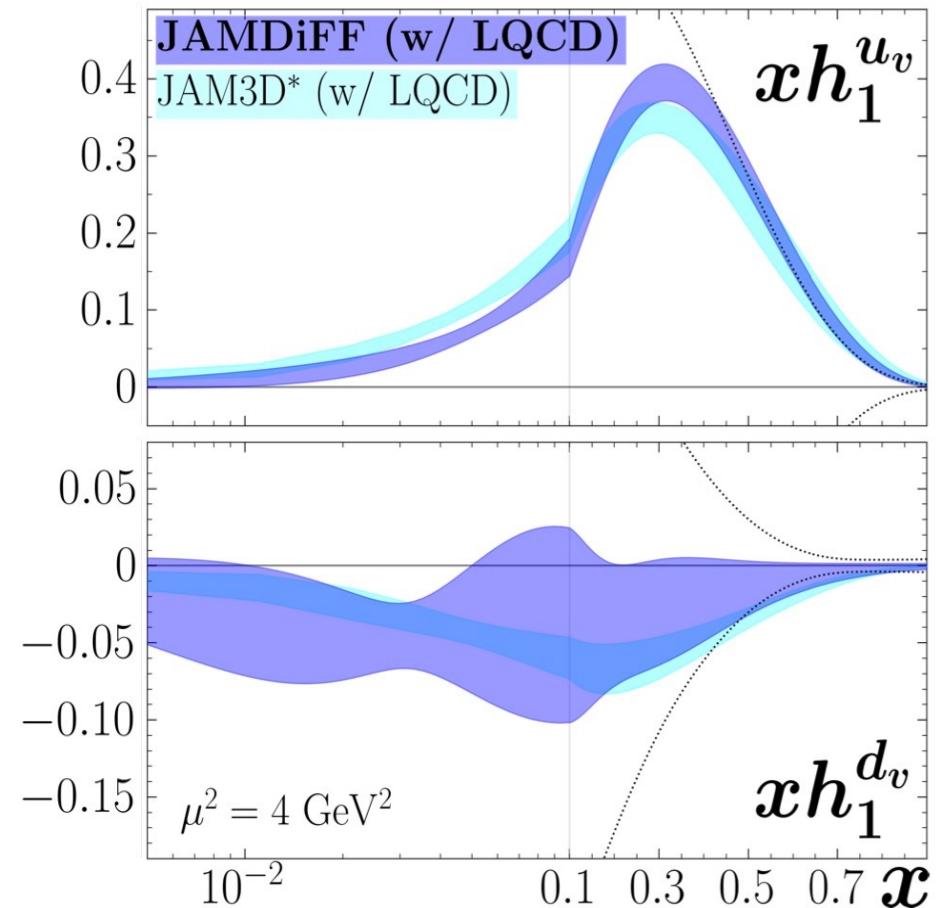

- Possible explanation for the shift ($\sim 3\text{-}4\sigma$ difference to a $\sim 0.3\text{-}2\sigma$ difference) in the phenomenological values of the tensor charges once LQCD data is used as a prior:
 - In order to further test the compatibility between LQCD and experimental data, it is of vital importance to have more measurements at larger x (for SIDIS) and more forward rapidity (for pp)

- Possible explanation for the shift ($\sim 3\text{-}4\sigma$ difference to a $\sim 0.3\text{-}2\sigma$ difference) in the phenomenological values of the tensor charges once LQCD data is used as a prior:

- The LQCD data and STAR $\sqrt{s}=200$ GeV data want a larger h_{I}^{uv} at large x , while the COMPASS proton data and STAR $\sqrt{s} = 500$ GeV data prefer a smaller h_{I}^{uv} .
- **In such a situation where there are competing preferences, and we compare analyses containing different subsets of the data, the choice of likelihood function and priors do not guarantee that the fits overlap within statistical uncertainties.**

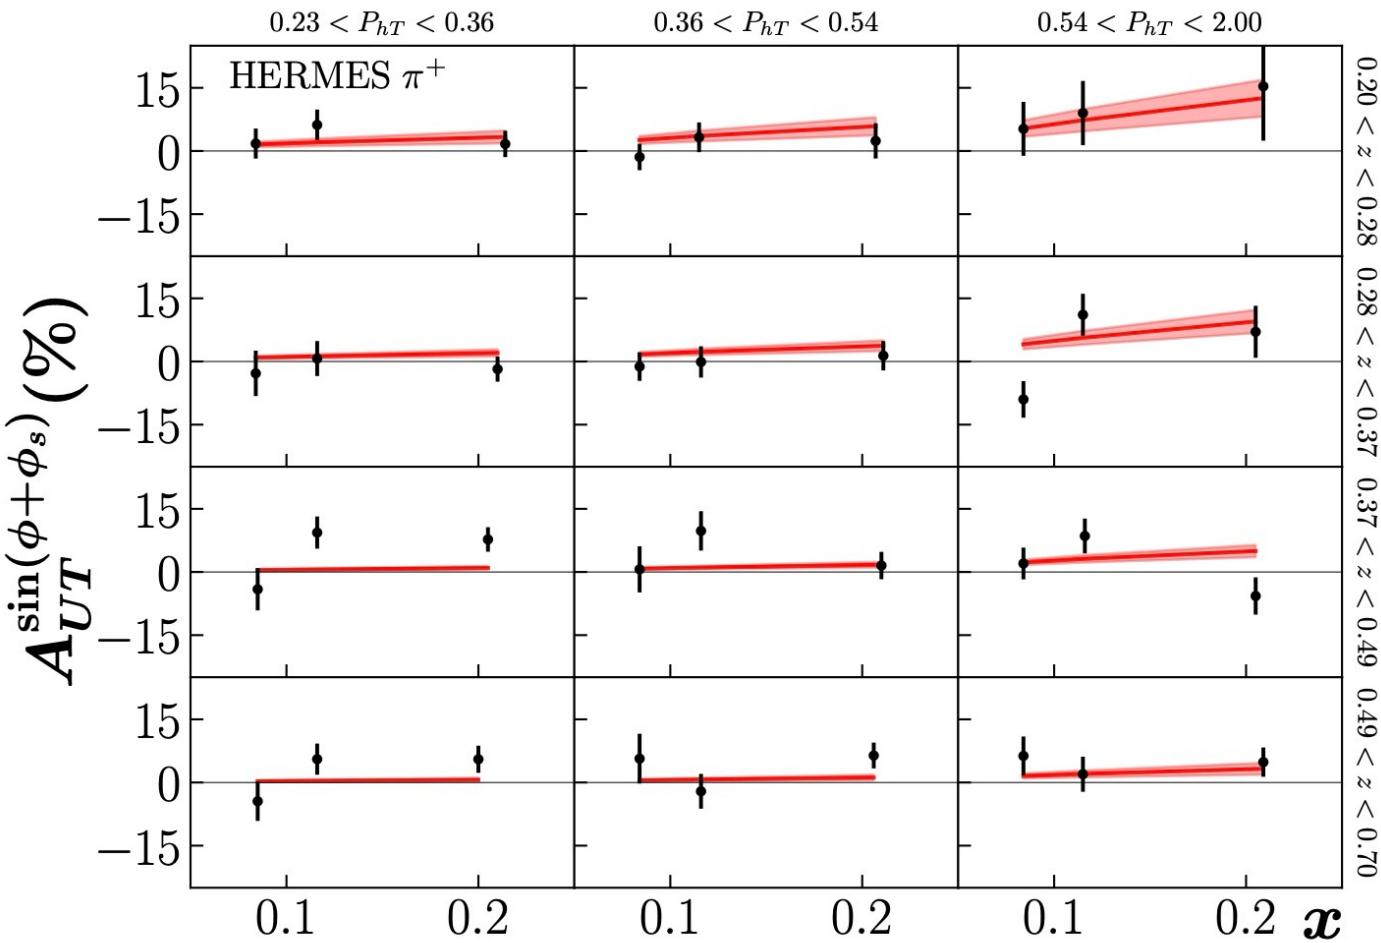

Recent analyses by the JAM Collaboration show agreement between single-hadron and dihadron approaches for extracting transversity as well as compatibility with lattice QCD tensor charges, thus demonstrating the universal nature of all this available information

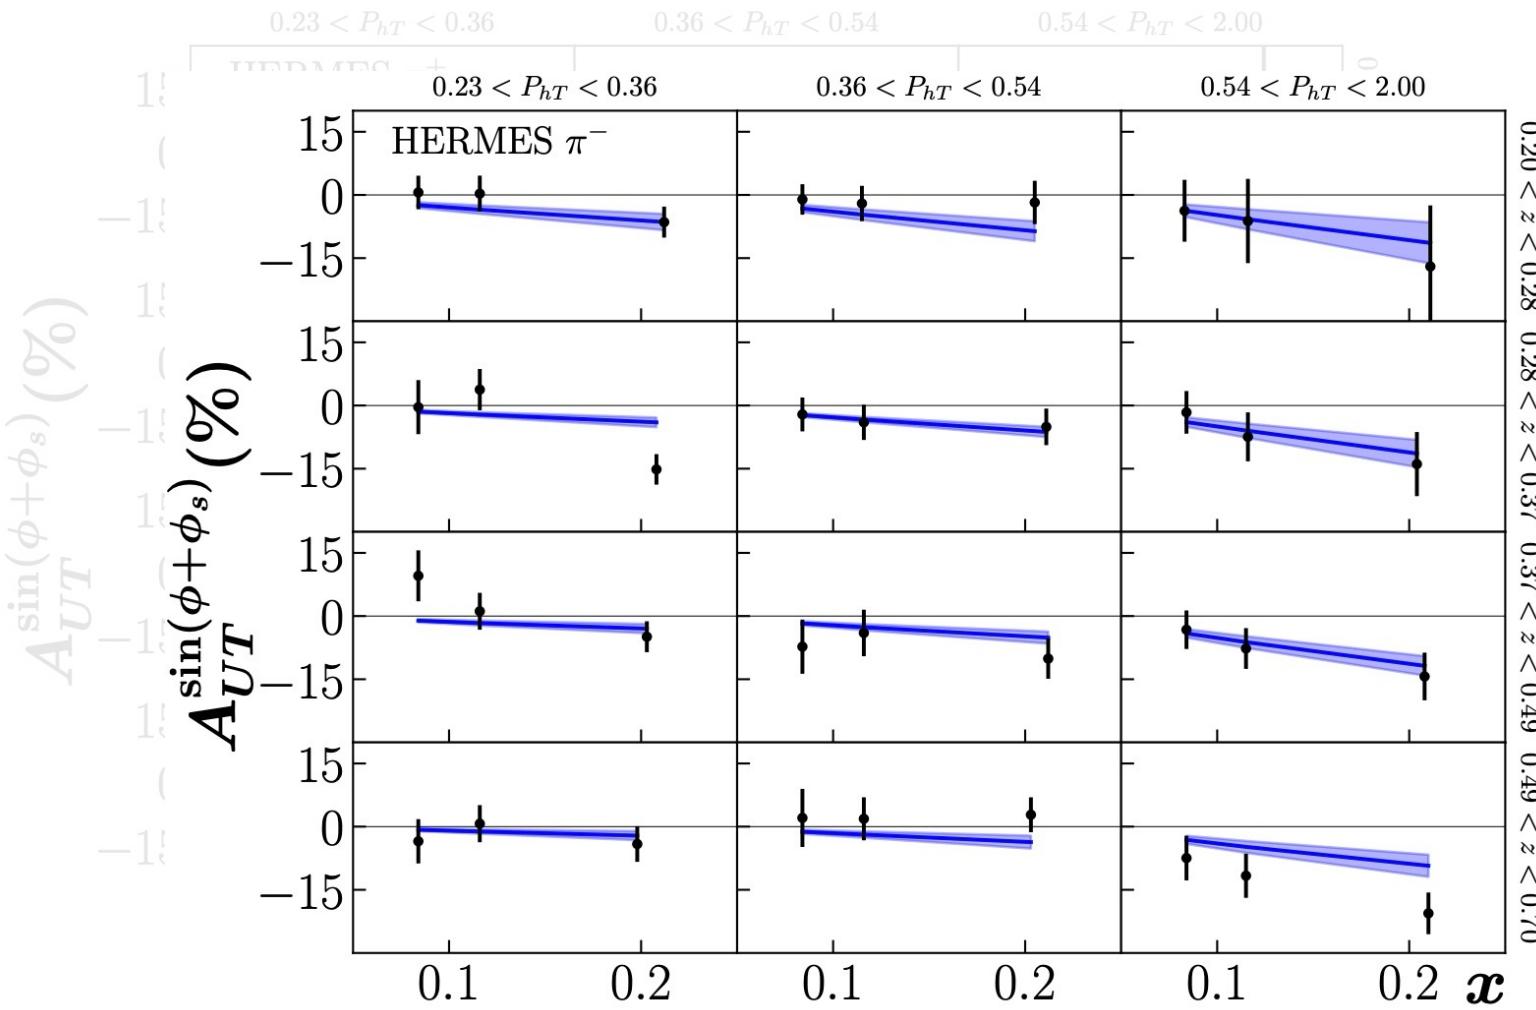

Summary

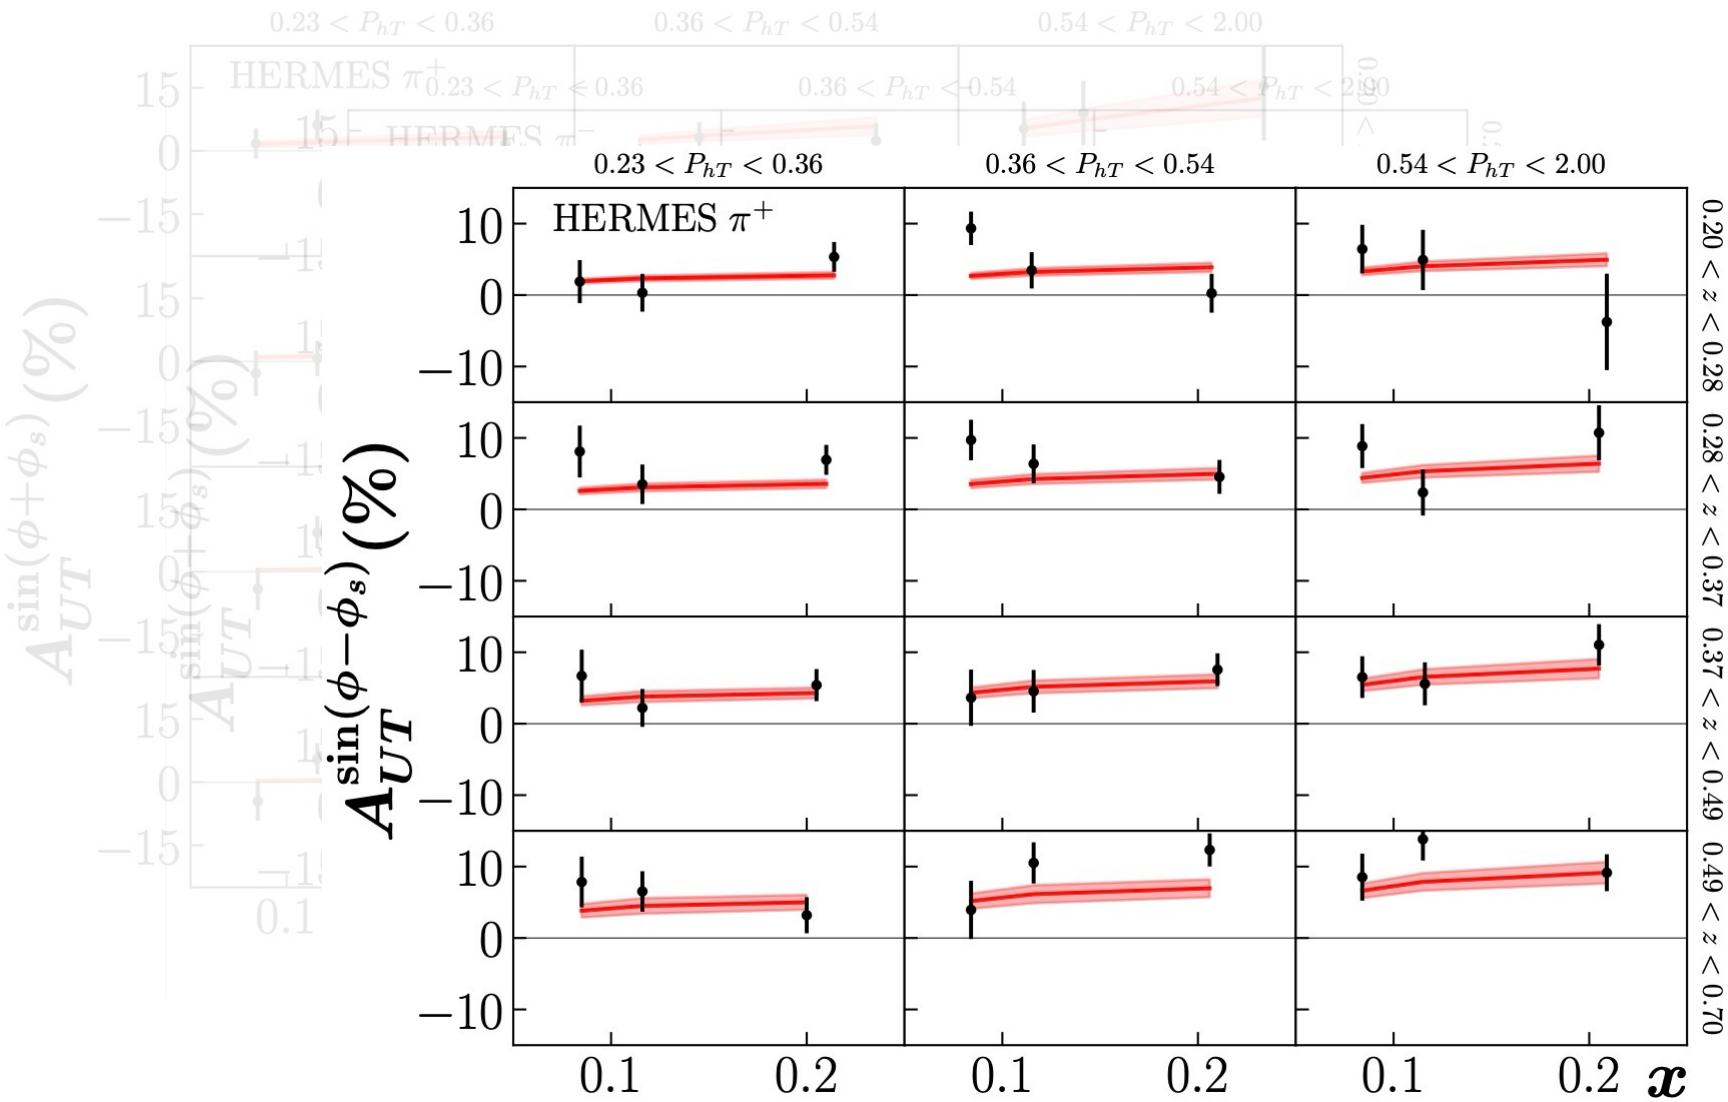

- There are two main approaches in QCD phenomenology to extract the transversity PDFs in order to compute the tensor charges: one analyzing TMD/collinear twist-3 single-hadron fragmentation observables, and the other utilizing collinear twist-2 dihadron fragmentation measurements.
- The tensor charges are fundamental properties of the nucleon that have connections to QCD phenomenology, lattice QCD and model calculations, and beyond the Standard Model studies (e.g., beta decay, EDM).
- Recent analyses by the JAM Collaboration (Gamberg, et al. (2022), Cocuzza, et al. (2024)) in both approaches show that lattice QCD tensor charge data currently can be accommodated within phenomenology, demonstrating the universal nature of all this available information.
- Experimental data at larger x is needed to further test the compatibility between QCD phenomenology and lattice QCD and mitigate systematic biases in that region.

$$D_1^{h_1 h_2/q}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T) = \frac{z}{32\pi^3(1 - \zeta^2)} \text{Tr} \left[\Delta^{h_1 h_2/q}(z, \vec{k}_T; P_1, P_2) \gamma^- \right]$$

*NEW definition of
dihadron FFs*

$$D_1^{h_1 h_2/q}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T) = \frac{z}{32\pi^3(1 - \zeta^2)} \text{Tr} \left[\Delta^{h_1 h_2/q}(z, \vec{k}_T; P_1, P_2) \gamma^- \right]$$

$$\sum_{h_1} \sum_{h_2} \int dz d\zeta d^2 \vec{k}_T d^2 \vec{R}_T D_1^{h_1 h_2/q}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T) = \underbrace{\langle \mathcal{N}(\mathcal{N} - 1) \rangle}_{\text{Expectation value for the total number of hadron pairs produced when the parton fragments}}$$

Note: Recent papers by Collins, Rogers (2024) and Rogers, Courtoy (2024) do *not* actually put into question our results regarding our DiFF definition being a number density.

Expectation value for the total number of *hadron pairs* produced when the parton fragments

$$D_1^{h_1 h_2/q}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T) = \frac{z}{32\pi^3(1 - \zeta^2)} \text{Tr} \left[\Delta^{h_1 h_2/q}(z, \vec{k}_T; P_1, P_2) \gamma^- \right]$$

$$\sum_{h_1} \sum_{h_2} \int dz d\zeta d^2 \vec{k}_T d^2 \vec{R}_T D_1^{h_1 h_2/q}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T) = \underbrace{\langle \mathcal{N}(\mathcal{N}-1) \rangle}_{\text{Expectation value for the total number of hadron pairs produced when the parton fragments}}$$

Note: Recent papers by Collins, Rogers (2024) and Rogers, Courtoy (2024) do *not* actually put into question our results regarding our DiFF definition being a number density.

$$e^+ e^- \rightarrow (h_1 h_2) X$$

$$\frac{d\sigma}{dz d\zeta d^2 \vec{R}_T} = \sum_q \boxed{\frac{4\pi N_c \alpha_{\text{em}}^2}{3Q^2} e_q^2} D_1^{h_1 h_2/q}(z, \zeta, \vec{R}_T^2)$$

total partonic cross section for
 $e^+ e^- \rightarrow \gamma \rightarrow q\bar{q} \equiv \hat{\sigma}_0^q$

$$D_1^{h_1 h_2/q}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T) = \frac{z}{32\pi^3(1 - \zeta^2)} \text{Tr} \left[\Delta^{h_1 h_2/q}(z, \vec{k}_T; P_1, P_2) \gamma^- \right]$$

$$\sum_{h_1} \sum_{h_2} \int dz d\zeta d^2 \vec{k}_T d^2 \vec{R}_T D_1^{h_1 h_2/q}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T) = \underbrace{\langle \mathcal{N}(\mathcal{N}-1) \rangle}_{\text{Expectation value for the total number of hadron pairs produced when the parton fragments}}$$

Note: Recent papers by Collins, Rogers (2024) and Rogers, Courtoy (2024) do *not* actually put into question our results regarding our DiFF definition being a number density.

$$e^+ e^- \rightarrow (h_1 h_2) X$$

$$\frac{d\sigma}{dz d\zeta d^2 \vec{R}_T} = \sum_q \frac{4\pi N_c \alpha_{\text{em}}^2}{3Q^2} e_q^2 D_1^{h_1 h_2/q}(z, \zeta, \vec{R}_T^2)$$

total partonic cross section for
 $e^+ e^- \rightarrow \gamma \rightarrow q\bar{q} \equiv \hat{\sigma}_0^q$

$$e^+ e^- \rightarrow h X$$

$$\frac{d\sigma}{dz} = \sum_q \hat{\sigma}_0^q D_1^{h/q}(z)$$

This is exactly the structure $d\sigma$ should have if D_1 has a number density interpretation (alternative definitions would introduce additional factors that don't give the expected parton model result)

$$D_1^{h_1 h_2/q}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T) = \frac{z}{32\pi^3(1 - \zeta^2)} \text{Tr} \left[\Delta^{h_1 h_2/q}(z, \vec{k}_T; P_1, P_2) \gamma^- \right]$$

$$\sum_{h_1} \sum_{h_2} \int dz d\zeta d^2 \vec{k}_T d^2 \vec{R}_T D_1^{h_1 h_2/q}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T) = \underbrace{\langle \mathcal{N}(\mathcal{N}-1) \rangle}_{\text{Expectation value for the total number of hadron pairs produced when the parton fragments}}$$

Note: Recent papers by Collins, Rogers (2024) and Rogers, Courtoy (2024) do *not* actually put into question our results regarding our DiFF definition being a number density.

$$e^+ e^- \rightarrow (h_1 h_2) X$$

$$\frac{d\sigma}{dz d\zeta d^2 \vec{R}_T} = \sum_q \frac{4\pi N_c \alpha_{\text{em}}^2}{3Q^2} e_q^2 D_1^{h_1 h_2/q}(z, \zeta, \vec{R}_T^2)$$

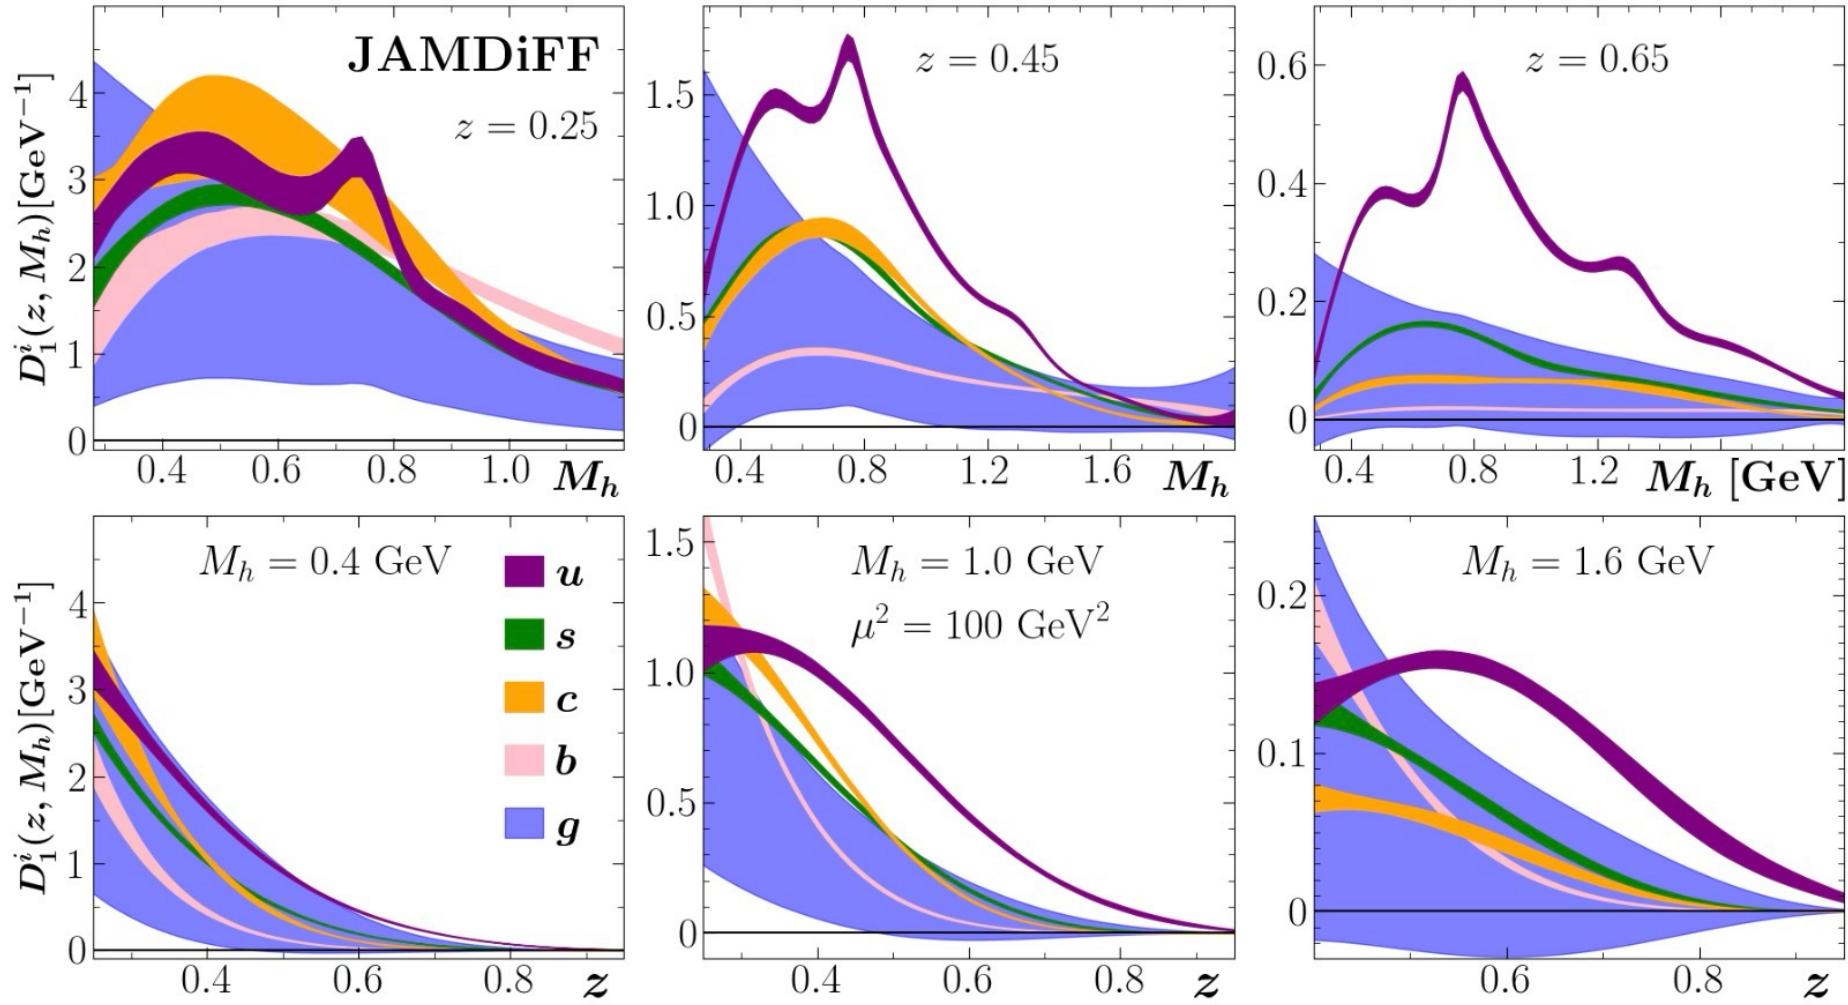

total partonic cross section for
 $e^+ e^- \rightarrow \gamma \rightarrow q\bar{q} \equiv \hat{\sigma}_0^q$

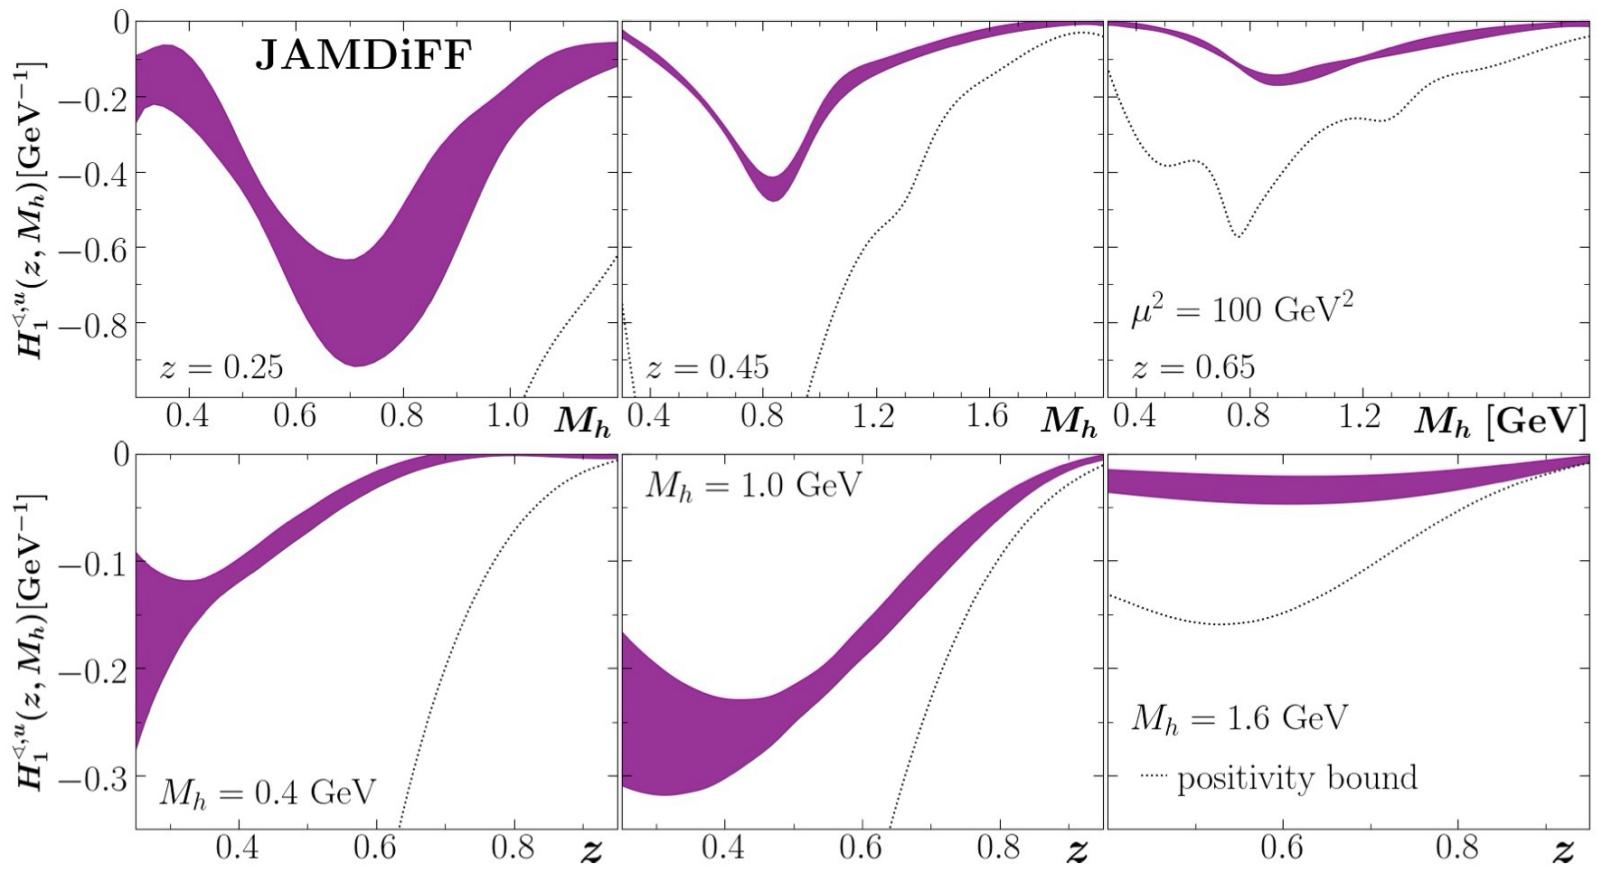

$$\left| \begin{array}{l} e^+ e^- \rightarrow h X \\ \frac{d\sigma}{dz} = \sum_q \hat{\sigma}_0^q D_1^{h/q}(z) \end{array} \right.$$

$$D_1^{h_1 h_2/i}(w, x, \vec{Y}^2, \vec{Z}^2, \vec{Y} \cdot \vec{Z}) \equiv \mathcal{J} \cdot D_1^{h_1 h_2/i}(z, \zeta, \vec{k}_T^2, \vec{R}_T^2, \vec{k}_T \cdot \vec{R}_T)$$

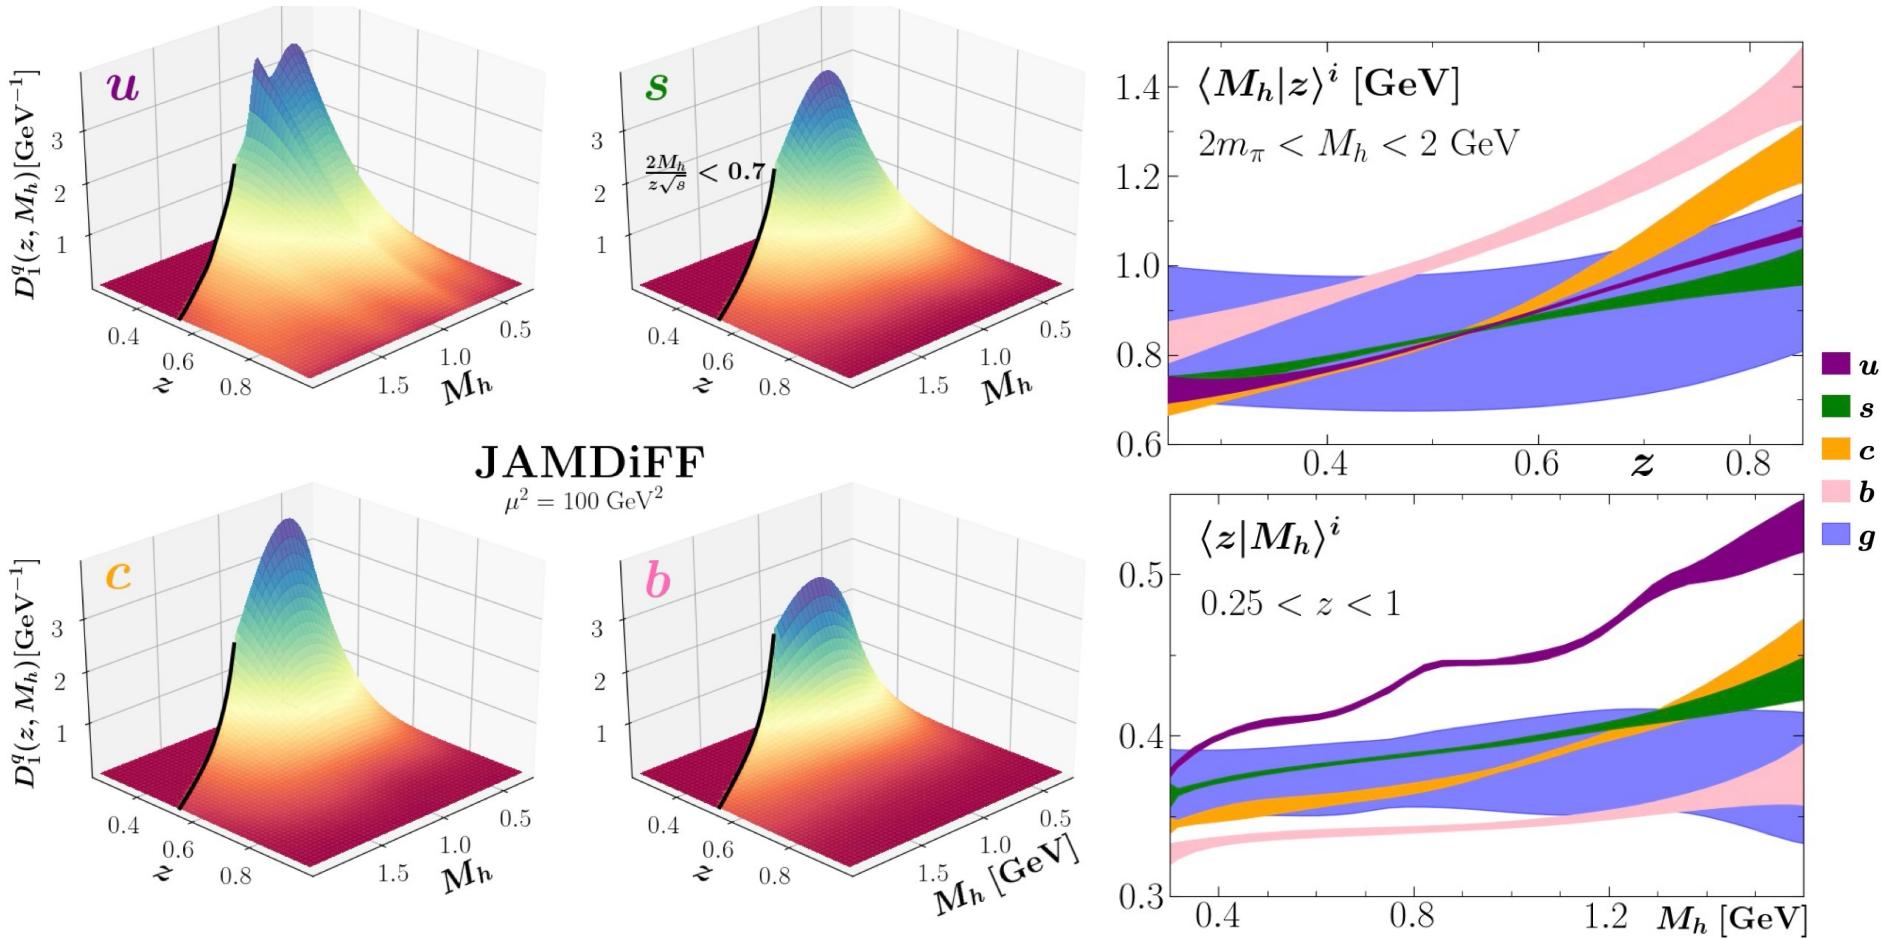

is a number density

Jacobian for the variable transformation

*DiFFs extracted from experiment now have a clear physical meaning:
they are densities in the momentum variables for the number of hadron pairs
($h_1 h_2$) fragmenting from the parton*

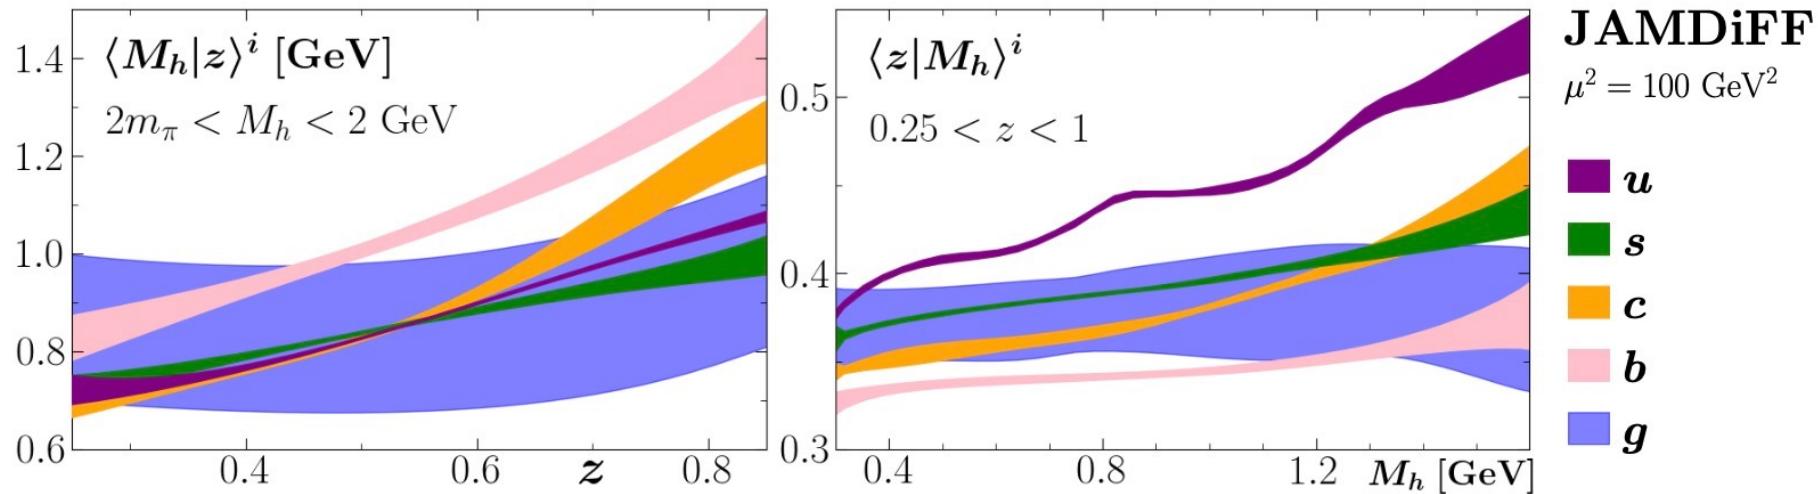

- Since $D_1(z, M_h)$ now has a number density interpretation, we can meaningfully calculate expectation values

$$\langle M_h | z \rangle^i = \frac{\int dM_h M_h D_1^i(z, M_h)}{\int dM_h D_1^i(z, M_h)}$$

↙
average value of M_h for a single
 $\pi^+ \pi^-$ pair with a given z formed from
the fragmentation of a parton i

$$\langle z | M_h \rangle^i = \frac{\int dz z D_1^i(z, M_h)}{\int dz D_1^i(z, M_h)}$$

↙
average value of z for a single $\pi^+ \pi^-$ pair
with a given M_h formed from the
fragmentation of a parton i

- At smaller z (where more $\pi^+\pi^-$ pairs are produced), we expect on average they will have a smaller mass, in which case the mass of the quark flavor becomes less relevant (b quark is so heavy it separates out even at small z).
- As less $\pi^+\pi^-$ pairs are produced as one nears threshold ($z \rightarrow 1$), then the mass of the quark more directly correlates to the mass of the dihadron.
- For a given M_h , $\pi^+\pi^-$ pairs need to carry smaller z if they arise from the fragmentation of a heavier quark (clear hierarchy is displayed).
- The uncertainty in the gluon DiFF is too large to make any definitive statements about the features of $\pi^+\pi^-$ pairs produced from its fragmentation.

- Response to comment by Rogers and Courtoy - arXiv:2404.02281
 - The potential issue about the violation of the number sum rule equally applies to single-hadron FFs. Nevertheless, the universally accepted number density interpretation of $D_I(z)$ (Collins and Soper (1982)) is not called into question.

- Response to comment by Rogers and Courtoy - arXiv:2404.02281
 - The potential issue about the violation of the number sum rule equally applies to single-hadron FFs. Nevertheless, the universally accepted number density interpretation of $D_I(z)$ (Collins and Soper (1982)) is not called into question.
 - *“Misinterpreting sum rules can have practical numerical consequences for phenomenological analyses”* ... The number sum rule for (single-hadron or dihadron) fragmentation functions (FFs) has never been used to constrain any phenomenological analyses, including those by JAM.

- Response to comment by Rogers and Courtoy - arXiv:2404.02281
 - The potential issue about the violation of the number sum rule equally applies to single-hadron FFs. Nevertheless, the universally accepted number density interpretation of $D_I(z)$ (Collins and Soper (1982)) is not called into question.
 - “*Misinterpreting sum rules can have practical numerical consequences for phenomenological analyses*” ... The number sum rule for (single-hadron or dihadron) fragmentation functions (FFs) has never been used to constrain any phenomenological analyses, including those by JAM.
 - “*Note that changes in variables here do not undermine the number density interpretation. If two different variable choices are related by a simple Jacobian J ,*

$$\frac{d\hat{N}_h}{d\Phi} = J \frac{d\hat{N}_h}{d\Phi'}$$

then $d\hat{N}_h/d\Phi$ and $d\hat{N}_h/d\Phi'$ both have equally valid number density interpretations in terms of their respective phase spaces, $d\Phi$ or $d\Phi'$ ”

... We agree, as we already made this statement in our paper (see main talk slides), but it is necessary to first show explicitly that one has defined a function that is a number density (either for the variable set Φ or Φ')

➤ Response to comment by Rogers and Courtoy - arXiv:2404.02281 (continued)

- “At lowest order in perturbation theory, the Jacobian factor can simply be absorbed into the overall hard factor to maintain consistency with a factorization formula.”

... $\tilde{D}_1^{h_1 h_2/q}(z, \zeta, \vec{R}_T^2)$ – different definition of the DiFF that is also supposed to be a number density in (z, ζ, \vec{R}_T)

$$\longrightarrow \frac{d\sigma}{dz d\zeta d^2 \vec{R}_T} = \sum_q (K \hat{\sigma}^q) \tilde{D}_1^{h_1 h_2/q}(z, \zeta, \vec{R}_T^2)$$

NOT the total partonic cross section for $e^+ e^- \rightarrow \gamma \rightarrow q\bar{q}$

$$\longrightarrow \tilde{D}_1^{h_1 h_2/q}(z, \zeta, \vec{R}_T^2)$$

cannot be a number density in (z, ζ, \vec{R}_T)
